Dial your ISP and then launch CAB. You should be ready to go.

This looks good. Since you can ping I assume your DIAL.SCR is
good. Could you explain the problems in detail and the version
of STing?

Erik,

A wish of thanks for your continuing to update your most
excellent program. Are you intending to make it commercial once
it's out of beta (v1.00?). I for one would send some cash your
way.

Yes, the PC was just a glorified typing machine. But it's not even close to that now. It seems evident that you're speaking out of hatred for PCs and/or people who choose them, and not out of knowledge. I'm not promoting PCs, but had to point out your error. No computer has to have Microsoft products running on it, nor Intel. There are many good alternatives to MSDOS & MSWindows operating systems, including BeOS, Linux, FreeDOS, and I know there's more but can't remember them right now. Intel makes the Pentium and Celeron processors, but there are several alternatives to those also. Like AMD, WinChip, and Cyrix. I personally try to stay away from the mainstream overpriced stuff. I have 2 Atari computers, but I'm interested in *ALL* systems. I don't know why, but I do love my Ataris. Probably the same reason the Amiga group loves their Amigas! I think it's cool that we've had diversity in computers, which has led to competition and the growth of the computer industry. I'll never understand why people let their love for a particular machine create anger and hatred towards fellow mankind. (note - I'm not directing this at you - just a general observation).

Just my 2 cents.
Happy computing to everyone!
Andy Blakely

Ok, following Daniel and Hallvard's suggestions, I have some software.
Now I have another problem. I downloaded MasterTracks Pro, but the demo
songs don't play correctly, I think there is some sort of mapping
problem between the Yamaha and the ST. I'm new to this whole MIDI thing.
What can I do to get them talking together correctly?

Source record: 64066

Are you using a 520st with external floppy or a 520STFM with
internal floppy?

If you have a 520st with external floppy drive: 1.check the
floppy drives model. SF354 is a 360k SS disk drive. SF314 is a
720k DS/DD disk drive.

If you have a 520STFM: Some models had 360k drives while others
had 720k drives. To test this just try formating a disk to
Double Density. If it formats and verifies that ~ 720,000 bytes
are available, then you have a 720k drive.

To verify your ST's available RAM memory: Download a system
analyzing program from an FTP site. (e.g. Use "Profile"
available at ftp://f.ms.uky.edu/pub2/atari/utilities/). Such a
program can tell you more info about your ST than you could ever
need to know.

Hope this is useful :)

>sequencers was? I'm speaking of the Edit/Sync/SMPTE-Track
programs
>originally put out by Hybrid Arts and then by someone called
Barefoot
>Software.

I believe SMPTE Track was the last available. The "gold" and
"platinum" versions of SMPTE Track are the last releases I know
of.

>Does anyone have any of these? I'd like to buy one but I want
to get the
>last version put out, ya know.

SMPTE Track uses an external box (SMPTEmate or SMPTEmate plus)
that works both as a key/dongle and as the SYNC interface o
SMPTE gear. You will need both the software as well as this
device. I have a lot of Hybrid Arts stuff as well as other Atari
MIDI gear that I have collected over the years. I need to make
an inventory and perhaps I will have an extra to sell. I will
only part with any Atari stuff if I still have another for my
collection.

3788. Re: MultiTOS ?

Newsgroup: comp.sys.atari.st
Date: 2000-03-21 00:00:00 UTC
From: bytor <marvinjrNOmaSPAM@mindspring.com.invalid>
Message-ID: <0f5c44d0.e10fbeff@usw-ex0102-084.remarq.com>
Source record: 64068

I am not meaning to make fun, but why do you want MultiTos ? Are
you aware of the other great multi-tasking OS for the Atari?
Of all of these, MultiTos has the most bugs and the least amount
of features.

Here is a list of other OS listed from my least favorite to my
favorite. All of these are still available and supported!!! :
1. Geneva (from Gribnif Software)
2. Mint (freeware)
3. MagiC 6 (from ASH)

The only reason I like MagiC better than MINT is the fact that I
have a users manual with it, but of coarse it costs a lot more
to get the manual :)

You can also get Debian Linux 68k to play around with. It is a
lot of fun, but not a great OS for your average user. It is well
worth the price though! I picked mine up for about $0 US :)

Hope this helps! If you still insist on MultiTos you can email
me and perhaps I can help you locate it.

You know, one thing I've thought of is if the Milan could run AmigaOS with
some small modifications in the OS. After all, AmigaOS runs on the Draco,
an Amiga clone which lacks the custom chip set ... If so, it might give the
Boxer (Amiga clone due out "soon" for you Atari fans) some competetion.

Maybe the Boxer could be modified to be the ultimate Atari clone as well? :)

you can't go too far wrong going to Tim Conrardy's MIDI and Atari site
at http://atari.atlantis-bbs.com/timidi.htm ; he's been tirelessly
making an effort to get the original programmers of ST MIDI software to
release their programs as freeware, and he recently succeeded in getting
both Dr. T's Tiger Cub and Passport's Master Tracks Pro released. You
might as well download both of them and check them out!

BTW, both of these sequencers work beautifully under NoSTalgia on the
Mac :)

At the time the 020 based 1200 came out, Atari had already launched the
Falcon which is uncomparably better. The Falcon has on board SCSI and IDE,
030 at 16MHz, a DSP and a Videl chip with support for VGA, RGB and mono
monitors.

Your loss. Platformers and shoot'em ups were not my cup of tea. I agree, the Amiga was better at those games. That doesn't make it a better computer.

They were mostly the same. Sound was usually better on the Amiga, but most of the games were designed on the ST and ported to the Amiga with no special routines.

Im looking into 2 pc's to sequence all of my gear. I have a IBM and hate it :) we have an Atari 1040 st in our studio but no software and we don't even know the system. My question is should i use an Atari 1040 st for sequencing or a mac performa 475. Both of these system are within my budget. I don't have allot of money. What do you guys think?

It's true, that Falcon has better hw-specs than _unexpanded_ A1200, but
Atari's have always suffered from bad OS. AmigaOS runs circles around the
Atari's OS(es) and makes Amiga therefore better for serious use.
And don't forget A3000 which had 030/25MHz, support for VGA and RGB, SCSI
etc before Falcons ;)

3805. New MyMAIL version

Hi all,

Now itï¿½s time again for a new MyMAIL version (0.96)

Please read the history file for update info.

You can download from this address:
http://www2.tripnet.se/~erikhall/programs/mymail.html

You can add or remove yourself from MyMAIL mailinglist.
The add/remove page is found at:
http://www2.tripnet.se/~erikhall/mymailupdates.html
The mailinglist are handled by MyMAIL automaticly.

If you find any problems with MyMAIL please let me know.

Thanks to all of you for all the help i get from you all.

Best Regards

Erik Hï¿½ll

Ain't there one in AmiNet?
Atleast I had once a ST emulator, but never had the rom, so I couldn't use it.

There was two problems with the Falcon, no where to buy it, no software for it.
There was alot more software for the A1200 when it came you got a bounche of
software which was adpated to it.

That's an easy one! Use the ST. It'll do midi sequencing as well as,
and probably with more reliable timing than any other computer.

There's PLENTY of free sequencers that work great available but if you have
bit more money to spend I would recommend you get:

Maybe a commercial sequencer such as Cubase/Notator etc. The manuals
that come with these will probably be a big help if you're not that
familiar with ST's.

A high resolution monitor (although you probably already have one of
these, and are not essential for some sequencers)

A hardrive to speed up disc access (again, not essential), there are
external ones available, but also can be fitted internally (with a bit
of soldering)

Go with atari's! They are tried and tested and cheap to
replace/repair if needs be (which probably won't happen)

Cheers, Simon.

Finally I checked this game (I heard about it long, long time ago). But I
was very disappointed, because it's almost same as old console game Robotron
from Atari (soft).
It exists for PC too, but in some way it's really Atari game :-) .

Actually much better, too bad Amigans got stuck with so many 16-color Atari ports which used jerky software scrolling and slow software "sprites". Fortunately that died off after a few years.

>> So am I missing something here? Which games were the best of the Atari

>
>You've obviously never played Dungeon Master :-)

Which the Amiga version beat the pants off of, thanks to the extra (stereo) sounds. ;)

>Nevermind, it'll end up as a flame war in a couple of seconds! ;-)

Heh, I used to first have C64/Atari 8-bit arguments with a cousin of mine, which later turned into Amiga/ST arguments.

Easy, use the ST. The Atari is the only computer to offer rock solid MIDI timing. Both the PC and the Mac are plagued with multitasking operating systems which interfere with real-time performance.

In both cases, the major investment will be the software. You can get Cubase or Notator for the ST, the PC or the Mac. Look out for original second hand copies and stay away from pirate copies, because these are pretty bad.

There is also quite a lot of freeware available, including programs that used to be expensive packages made freeware by the authors.

A 1040 ST is pretty much enough to get started, although you'll need a monochrome monitor. A hard drive is nice to have but not required.

I don't think the one is better than the other for serious use. The main advantage of the Amiga was multitasking, which was a moot point in 1988 with 512K RAM (when I was on the market for a new computer).

It seems to me that in the Atari was quite widely used on it's own niche markets (DTP and MIDI), just like the Amiga in Video.

Nowadays Atari has quite a large offering of OSs, with TOS, MiNT or MagiC (or Linux of course), with features comparable to the Amiga OS.

> And don't forget A3000 which had 030/25MHz, support for VGA and RGB, SCSI
> etc before Falcons ;)

The TT had an 030 at 32MHz, SCSI, VME, LAN, MIDI, no VGA but support for 256Mb RAM, before the A3000 ;-)

At least the Atari clones are actually in production ;-)

Seriously, the systems were all pretty much comparable. Neither one is better or worse than the other. Both have some great communities, which is what sets them apart from today's PC or Mac world.

Methinks this thread, posted to both amiga and atari newsgroups was a bit of a troll. It should actually be directed to the advocacy newsgroups.

As far I know System Solutions still sell TOS2x roms he/she could
contact them at sales@system-solutions.co.uk
also Upgrade Shop at dave@tusdev.demon.co.uk
as for Tos image can be obtained by use of a upgraded Stfm 2.06 with the
software from most emulators like gemulator tosbox pacifis. I hope this
will prove useful.

Source record: 64192

I am trying to use CAB 2.7 to surf the web. I am having
troubles. I have a German version using D&D translation .rsc
files to English. My manual is in German :(I only read English.

I am using STing and am able to dial and ping my ISP. I have
copied CAB.OVL v1.4 into my modules folder.

Now, how do I surf the www? Do I dial first and then launch
CAB.APP? Anything else I need to do before I can access a URL?

Thanks for all your help in advance.
Long live ATARI !!!

Hi,
On my 520ST I thought I had the default 512k of RAM but it can
copy 720k floppies without swapping disks halfway, Whereas when
I use pacifist set up for 512k of RAM it stops halfway and switches
disks before switching back. So does the fact that my machine can
copy the 720's without swapping mean that it's been upgraded in the
past??

How so? TOS has always been rock-solid and built-in on ROM.

> AmigaOS runs circles around the Atari's OS(es) and makes
> Amiga therefore better for serious use.

And MiNT matches or beats AmigaOS on most things (although, when
Atari was involved, it wasn't half as developped as it is now).

> And don't forget A3000 which had 030/25MHz, support for VGA

Here, I have to agree. Except for Germany and UK, Falcons were
rather hard-to-find. When I still lived in Canada, many people
waited forever for one and never got it. Blame the Tramiels.

Absolutely not! For MIDI, a plain jane ST is the best.

An STE is even better, because upgrading to the full 4 MB of RAM
and TOS 2.06 can be done in 5 minutes. It's also easier to
retrofit an internal IDE hard-disk/controller in an STE.

A MEGA/STE is very good too, but then again kindof overkill.

A TT is, oddly enough, the worst choice for MIDI apps, as the
cartridge port is slightly incompatible and most of the hardware
enhancements over an ST cannot be used by most applications.

Even worst, some classics like X-oR and Notator simply do not
work on anything else than an ST.

A Falcon is great if you wanna experiment with Cubase Audio, but
then again the SCSI controller is such shit that one might as
well invest into a proper hard-disk recording system by Roland or
Alesis and use an ordinary ST for sequencing.

I'm gonna have to stick a sock in your mouth on this one! ;-) The TT does VGA just fine, without any extra graphic card. Beleive me I know: I am using one right now as I'm writing this e-mail.

And yes, it _did_ come out before the A3000.

Iggy Drougge <optimus@uno.canit.se> scribbled the following
on comp.sys.amiga.games:
: Actually, the Atari's audio is vastly inferior to that of the C64. Its
: waveform variation is nonexistent, whereas there are four types in the SID
: chip.
: What ade the Atari renowned for audio uses was its MIDI hard and software,
: not the poor Yamaha chip.

Iggy, where have you been? Why aren't you on ATT any more?
I have never used the Atari myself, but seeing how good the C64's audio
was, I wouldn't be surprised if it was superior to the Atari's.

You have no experience whatsoever of FM sythesizer programming,
do you? That chip inside an Atari is essentialy a Yamaha DX9
synthesizer on a chip. Anyone familiar with FM programming will
know that even a basic 4-operator chipset can produce a rather
good variety of sounds.

It hasn't. TOS 2 and 3 are _exactly_ the same, functionally.

The only difference is that TOS 3 is _fully_ 32-bit optimized and
returns various cookies to indicate TT hardware is present.

The very slight upgrade is in TOS 4: color icons and 3D effects
in the AES, and a maximum partition size raised to 1 GB.

They decided to focus on developing a hard-disk recording system,
as I recall. It was even based on a MEGA-ST, initially.

The SMPTE Track programmers were allowed to continue develpment
of their product on their own, thus Barefoot Software was born.

Well if anything my loathing of PC's is the fact that they have killed off completely any element of diversity. The diversity of the eighties and the early nineties was for me so much more interesting, it was like each platform was like a football team you support, something you'd defend. Im not advocating hatred, but Ill admit I was furious when everybody abandoned their 16bits for the PC. It was sad really, watching everything that had been there before disappear. Yeah if I got a PC myself (Although I suspect Id plumb for a Mac) I would probably get an AMD K7 with a Linux OS just to stick two fingers at that monster Bill Gates who should be tried for crimes against humanity. Can you imagine just how much this man has held computers back with his inferior products?
I myself do appreciate all platforms for their respective virtues Atari,Commodore,Amstrad and Spectrum, in fact I personally wouldn't mind knowing more about Atari's products: When was the ST released? And whats the TT? And the Mega ST? And the differences between the STE? And the 1024ST? Did Atari make any other consoles apart from the Lynx (Which I liked) and the Jaguar64 (which apparently wasn't truly 64 bit). And I take it there was an Atari 8bit computer to rival the C64 and CPC?Is this an Atari XL?
Answers please!
And yes happy computing to everyone.

3841. TOS vs PRG?

Newsgroup: comp.sys.atari.st
Date: 2000-03-22 00:00:00 UTC

This might seem really simpleton-like, but...

I never really got into the nitty gritty of the Atari OS; I just ran one program (Notator) and off I did my music.

My question is: what's the difference between a *.TOS file and a *.PRG. Both seem to run programs that have an interface. With the ones I have tried, TOS files have a non-gui interface while PRG files have gui interfaces. But I haven't tried that many (maybe 3 or 4). And some TOS files, if I recall, didn't seem to do much of anything other than flash the screen for half a second before going away and I could see nothing on the desktop to indicate otherwise.

>mini-icons to the left of the text line. I don't know what either does.

We still don't know the purpose of the icon with the series of horizontal lines, however the other icon changes to reflect whether it's a URL or a link to a local HTML document (a representation of a floppy disk).

>Does anyone have any instructions about the new hotlist in CAB 2.7 -
>English or German? If so, any chance of a copy, please?

To expand this out, how about some hints and tips using CAB? For example, clicking on a link with the (Shift) key opens the page in a new window, save time if you need to go back to the original page.

Is there a way (ie. a program) that can fix a damaged boot sector on an ST formatted hard drive? I'm thinking that it would work a similar way to how DOS/Windows boot disks allow you to do a SYS C: and the boot disks operating system is copied to the the hard drive and subsequently you can boot from the HD.

Your help would be appreciated (2 HDs died tonight)...

```
You've just answered your own question. The difference between a TOS and a
PRG is that PRG (and APP) use GEM.

A bit off topic but there is now alittle synth based upon the SID chip now.

I got my Atari (Stacy & Falcon) to do midi work and the only top midi program for the Amiga that I knew was Barrs & Pipes which was gobbled by Microsoft.

well there are two types of TOS files/programs.

One is actually a compressed file (LZH or ZIP) that has been made to be
self expandable
with software, so the name changes from program.lzh to program.tos
double clicking this files expands the compressed file back to its
original constituent files.

the second TOS runs in a terminal window, and is text mode. There are
variants on this such as TTP programs (Tos Takes Parameters) which when
double clicked on will bring up a window where you can enter parameters
such as
-x in stzip.ttp to eXpand files, then clicking OK continues on and runs
the programs with the parameters you have, or have not given it.

To add a few more, TTP are like TOS with parameters, and GTP are like
PRG with parameters. Why both PRG and APP are used, I don't
know. Sounds pointless to me.

3850. still not working/hard-drive help

Newsgroup: comp.sys.atari.st
Date: 2000-03-22 00:00:00 UTC
From: dzander@solaria.sol.net
Message-ID: <38d8d99a$0$40649@news.sol.net>
Source record: 64096

Nothing is making sense. I downloaded AHDI5, uncompressed it onto a blank disk and booted it, it said "NO DEVICE" and "NOT BOOTED", then I turned on my hard drive and allowed it to spin up, then I go into the auto folder and manually double-clicked on "ahdi.prg" and it runs and again says "NOT BOOTED", then I create an ICON for the C drive and attempt to open it and it says "DEVICE NOT INSTALLED" (or something to that effect), then I go into the HINSTALL directory and run the program called hinstall.prg and it says that there is "NO LOGICAL DRIVE OPEN FOR DRIVER" and it removes the C drive icon from the desktop.

What is going on?! I thought AHDI.PRG was a hard disk *driver* that I am supposed to use to access my hard drive?! I feel like taking my hard drive, my modem, my floppy disk, my monitor, my mouse, and my Atari ST computer and throwing them out of my window!

Anyone have any solutions on how I am supposed to get my hard drive back?

Bear in mind that what you will get are UK roms. The language
style probably won't be a problem, but the different keyboard
layout might be a challenge.

Hallvard, please read carefuly and in context. The above means
it works on ST. It will not work on TT or Falcon, which is what
the poster seemed to think might be a better machine for MIDI.

Right... all those things in my AUTO folder are GEM applications.

ROTFL!

TOS: vt52 applications
TTP: vt52 applications (takes parameters)

APP: GEM applications
GTP: GEM applications (takes parameters - seldom used)

PRG: text or GEM program (deprecated, except for AUTO folder)

Actually, you can use DESKTOP.INF to define **any**
extension to be a runnable file. In the past, there
was one user who converted runnable file names to
*.LOR (LOw-Resolution color), *.MED (MEDium resolution
color), and *.HIR (High Resolution monochrome) on his
ST. That way, he always knew if a program could be
used in his current screen resoution.

Double-clicking on PROGRAM.LOR caused PROGRAM to load
and run, just as if it were an APP or a PRG.

The tricky part was modifying DESKTOP.INF using
a text processor. But once you got THAT done, it
was smooth sailing.

>I'll never understand why people let their love for a
>particular machine create anger and hatred towards fellow mankind.
>(note - I'm not directing this at you - just a general observation).

The only hatred being directed ought to be at Bill Gates.

The DOJ and Caldera/DR DOS cases underline the problem with Microsoft and the Story of a DOS GUI that Conquered the World through Market Power rather than Technical Merit.

I have my own peeve - we used to run Borland C at work, which was superior to Microsoft C in every way - faster compile, smaller binary, better tools (MS didn't even have a grep program), nicer development environment, etc. Then when Windows came along, MS started putting in "magic numbers", which of course they knew, but any other compiler maker like Borland who didn't was SOL. Was this legal? I guess... maybe... Was it Good? NO! Not for competition, and not for us users.

And the original Intel processor architecture is so inferior to Motorola's... but that's why 68K became the de facto standard in industrial controllers, rather than x86. It hasn't been until recently, when x86 won the market war, that embedded x86 products (even on VME, ugh), have started dominating.

So the opinion being expressed is not hatred of mankind, but outrage against the situation where an evil software company and a mediocre but lucky silicon company have driven all the interesting machines (which came from technically brilliant companies with zero marketting savvy) off the scene.

Funny that Amiga users always take the original TOS 1.00 ST as a
reference when trying to justify why Amiga might be better, but
do not accept that Atari users compare a Milan to an A1000.

I changed keyboard layout long time ago, when I translated German TOS 2.06
to serbian language. I put keyboard table from English TOS 1.04 on right
place, and it works fine. As I remember it's couple hundred byte long.
Keep in mind that patching of TOS 2.06 is one of favorite Atarist's
occupation... :-)

if there is still now joy try another Hard disk driver program.
My last experience with hard disk can be various
1 check cable SCSI or acsi no wires loose if you have a spare check with
this one. just because the cable is attached doesn't mean it says hello
to each other.
2 if your hard drive spins and sound like it is slowing down. it could
be the power system internally.
3 check that you have all the correct software downloaded
4 try another fresh harddisk driver
5 cheer up it happens to everyone at sometime I still have all my two
teeth and a nicely glued computer to boot to look at.
>
>
> Anyone have any solutions on how I am supposed to get my hard drive back?

so what do you prefer to compare?

i would assume this as being fair:

Amiga 1200 - Falcon 030

the gfx hardware:

both machines have bitplane modes up to 8 planes, the amiga
is much more flexible here, allowing anything from 1 to 8
planes, while the falcon only allows 1, 2, 4 and 8. the falcon
still has no scroll registers and has a hard deal moving all
8 bitplanes.

also annoying is that the falcon only allows 6 bits per color
gun in the palette while the a1200 allows all 8 bits, so the
total amount of displayable colors on the falcon is max 262144
and on the a1200 it's 16777216.

both machines offer a special graphic mode which is different
to that bitplane stuff. the amiga offers the HAM mode which
has a lot of color restrictions and is only useful to display
pictures. the falcon has the 65536 color mode which is very
nice but also has a heavy dma load.

at the time i was very annoyed that the amiga 1200 didn't offer
a hicolor mode as the falcon, but you can "fake" a similar
mode with ham so you get a 262144 color mode.

for the special hardware features the amiga offers some things.
first there are the sprites. sometimes they are nice but mostly
you can forget about them.

what the falcon (and also todays PCs) really lacks is the copper.
with this small processor you can configure your display freely
without using interrupts and similar hacked stuff which mostly
kills different machines.

the blitter:

the blitter of the falcon is still a joke, nothing compared to
the very flexible blitter of the amiga. the only things it
can do is to copy memory and fill memory...

the amiga's blitter is much more useful, it has 3 sources
and 1 destination, a lot of masking registers, a not-so-very
useful fillmode and is able to draw lines to bitplanes very
fast.

well, the blitter is not of use that much since both computers
have fast enough processors.

while we are at it: the processors.

the falcon has a 68030 running at 16 MHz, the 1200 has a
68020 at 14.xx MHz. the difference between 020 to 030 is
very small, all opcodes execute as fast on 020 as they do
on 030, the data cache of the 030 is only of use with
very fast ram which neither the 1200 nor the falcon has,
so here it's almost equal... almost, if the 1200 didn't
have support for 32 bit ram. okay, in most cases you had
to buy a small memory card but it was worth it. the 1200
nearly got 4 times as fast as without fastram, without
processor upgrade. i have heard of fastram cards for
falcon, but at the time i owned a falcon no programmer
had taken notice.

the OS:

atari has put two os's to the falcon package: TOS and MultiTOS.
the amiga comes with AmigaOS 3.0.

i'm sorry to say this but here the amiga definitely kicks the
falcons butt. TOS is a weak attemp of doing a graphical os and
lacks multitasking, multitos doesn't lack multitasking but is
still a very weak attemp.

amigaos 3.0 has a lot of features even linux or windows still
dream of like true datatypes, localization support etc.

what i didn't talk about yet was the falcon's dsp. a (for that
time) very fast processor without a proper memory interface.
it carries 56K of memory, but is a bit difficult to reach from
the 030's side of view. you can do some demos with it, but in
every days life you can just forget it.

i'm sorry, all in all my choice remains the same: from those two
machines i definitely choose the amiga as the favourite system.

and before anyone cries: yes, i owned a falcon (it got destroyed
when the flat of some friends burned down) and i also programmed
stuff on it. still, the hardware AND the os of the amiga is better
designed.

Graham.

PP,
I'm not the resident expert on HD's but you might think of re-installing
the driver itself (not the hard drive or re-partitioning/re-formatting)
making sure drive "C" is selected as the boot drive. Hopefully that's all is
needed! Maybe you just lost that selection somehow!

Hello
Does someone know something about Jack Tramiel, Shiraz Shivji and all
the other heros of the good old ATARI days?
What are they doing now?
Is there a chance to contact them (e-mail)?
Did they have old relics or prototypes?
Greetings
G. Kï¿½rner

> rlcolli@ibm.net

Hi Ryan:

Yes..You are correct. It has to do with Patch changes not corresponding to what you have on your own keyboard. The way to do it is, if it says PIANO on the track name, then find which patch has a good piano sound on the yamaha, and change the PATCH NO in Master tracks pro that will correspond with it. It's basically that simple. Or you can change the patch no's in MT Pro and audition it to see what sounds best. Thats what I like about MTPro is that you can set up patch changes very visually. Hope this helps

There are 96 KB on Falcon (32 K Words in 24 bits), it's not
enough if you want use lot of DSP effects in the same time,
and it's very hard to create an MP3 player.

>the 030's side of view. you can do some demos with it, but in
>every days life you can just forget it.

You can listen MP3 in D2D with DSP ;-) there are 2 players.

>i'm sorry, all in all my choice remains the same: from those two
>machines i definitely choose the amiga as the favourite system.

And you have forgotten to compare sound system ;-)
On Falcon there are 8 channels who works in 16 bits for input/output.

Regards,

Didier.

PS. I don't kown if is a good idea to compare amiga to atari, the
'war' is finished now.

How many decades ago was that? All Falcon ram upgrades are
TT-RAM based (except Atari's own).

[TOS, MultiTOS vs AmigaOS]

> amigaos 3.0 has a lot of features even linux or windows still
> dream of like true datatypes, localization support etc.

Amiga OS 3.0 was available in 1993, when MultiTOS was released?

Overall comments

Most of the points about the sound and graphic hardware of the
Amiga that you mentioned are well taken and were noticed before.
Amiga still is a good game coding machine. However, Atari is
better at serious applications such as MIDI and DTP.

IMHO, as an Atari user, the Falcon was a real joke and is just
not a good reference point at all. It did not deliver the goods
it promised and the hardware combination is a complete joke, as
it mostly was a horrible demo for clever Jaguar technology ideas.

However, if you take a well-equipped TT, Hades or Milan running
N.AES over MiNT, it measures up rather well against any Amiga.

Of course that reinstalling of driver is best solution. I don't know is original poster knows which driver he used. Also I'm afraid that there is some hardware failure, because 2 drives 'died' in one night.

Back to original question: no such program for Atari, but also no for PC too. Fdisk will recover your boot code, but you must type: fdisk /mbr . And it will install booter which not must be same as that which was on the drive. But it works, because booting is standard.
If partition table is damaged, then you are in real trouble. It's possible to recover it, but it needs good knowledge, some time and disk editor program.

how many decades it was ago that people used a plain 1200?

i just took these two machines since they are a good comparision
to each other, similar to 1040ST <> A500.

no, but amigaos 2.0 was available which was a big step ahead
since 1.x, far bigger than the step from 2.x to 3.x

i agree with midi, but i disagree with dtp. the main reason why
ataris were used as dtp machines was the not interlaced high
resolutions. but since a1200/4000 the amigas have freely
configureable sync registers which allow almost any video
output (yes, you CAN destroy monitors with it :) so the point
of the interlace-flickering is no more.

> However, if you take a well-equipped TT, Hades or Milan running
> N.AES over MiNT, it measures up rather well against any Amiga.

against what amiga? nobody uses a plain 1200/4000 anymore, the
least thing you can expect is a 68060, people who seriously
use their amigas have ppc inside.

Graham.

I used Latin characters - in serbian we use both Latin & Cyrillic. For YU specific characters (they are same in Slovenian, Croatian & bosnian language) I used non-standard code, actually some rare used characters at end of ASCII table. Whole translation was mostly for my own fun, and surprising nobody here was interested for it.

You need some literature about TOS, GEM. I have excellent German book 'Atari ST Profibuch'.
Fortunately today you may find lot of system info on the WEB. Also disassembler, RSC editor is required.

it just so happens that NoSTalgia, the ST emulator for the Mac, was written to emulate the MIDI ports of the ST, and indeed it appears to work well - in fact, I demonstrated this at our TAF meeting last week :)

There are two ways to handle MIDI with NoSTalgia, one is with the Opcode MIDI drivers and a MIDI adaptor, the other allows for the MIDI output to be done through QuickTime (QT supports the General MIDI standard, and the sounds are similar to the Roland SoundCanvas).

Of course, in order to make the most use of NoSTalgia, you need a pretty fast PowerMac to utilize it, and you'll have to turn on the "CPU Hog" option to allow for optimum horsepower for the emulation. I did the demonstration on a UMAX C600/180e Mac clone, and while Tiger Cub worked well, some members did notice the playback was a bit jerky. I would imagine if I had a G3 model to do playback the results would be much better.

Also of course remember that you wouldn't be able to run Notator, Logic or Cubase on NoSTalgia due to the dongle issues. However, I've tried both Tiger Cub and Master Tracks Pro under emulation and both ran well.

not so funny when you consider a certain Mac Advocate with no life constantly attempts to make brownie points when he compares TOS 1.00 to Mac OS 9 :)

3885. Re: Atari for MIDI

Newsgroup: comp.sys.atari.st
Date: 2000-03-22 00:00:00 UTC
From: Forrest Egan <fegan@iname.com>
Message-ID: <DrdC4.4868$l34.281849@news3.mia>
Source record: 64131

All,

Well, I've had a number of people contact me. Some had VERY nice machines to offer, but none are in my price range.

I found an IBM 760XD (Pentium 166 MMX laptop with 64MB RAM and a 3GB hard drive) that was collecting dust; so I've given up on my Atari search for now and I'm just going to look for software for Windows.

Hope I have better luck with my new search!

1) Is there a general MIDI newsgroup that anyone can recommend to locate suitable Windows software?
2) Might anyone in this newsgroup have an opinion on Windows software?

If so, please e-mail me directly as those responses would be off-topic for this group.

Thanks everyone for your help,
Forrest

it was slow at what?? 3d rendering?? as far as the actual multitasking was concerned there was never any lag switching between programs on a 1meg 68000 machine - maybe that was because of the preemptive multithreading - not to bad for an OS that came on 1 floppy.. and sure, it didnt have protected memory or anything like to keep a program from crashing the system, but it was badly written programs and not the OS that were unstable..

Are you saying that the computer is booting off the hard drive
yet you are not getting the "C" partition?

If so, try looking at the FAT table... you might have a
corrupted drive, which would hint at either bad cabling or
improper termination.

...and then Robert Semaan supposedly bought the company (I have heard he didn't finish paying for it, so MAY not actually own the whole thing). He renamed it Binary Sounds. I managed to purchase EditTrack Platinum from him, but it took him a LONG time to finally deliver the goods. Edit/SMPTE Track Platinum is the last commercial version of those programs. I think I recall seeing one of the USA Atari dealers still haveing them in stock on their web page. One of the original developers is still looking into further developement. Robert Semaan doesn't seem at all interested in doing anything at all in developing it or selling it, or giving developement rights to interested parties, etc., so I guess I'm trying top say that Hybrid Arts is very much in limbo at the moment.

If you want to run Edit/SMPTE on a Falcon, you have to get Platinum, as ealier versions (including Gold) won't run on the Falcon.

OK- found it at B & C computers.

http://www.myatari.com/bc520sw.txt

(Prices in US Dollars)

Edit Track $30

SMPTE Track $60 (without hardware) Hmmmm... that program should need the hardware as it functions as the copy key too. But - I think there is a version that works without it. Essentially Edit Track. That's the only difference between the programs. One has all the sync capabilities, the other doesn't. Better check first if you want to order one.

EZ Score Plus $30 That's a basic notation program by Hybrid Arts.

They also had HybriSwitch for $10. That was Hybrid Arts' own "multi tasking" system, which I had working very nicely at one time.

Hope that helps,

Clayton Murray
Seattle, WA USA

You can just re-install the HD driver using whatever utility was supplied on
the floppy containing your HD software. This will re-write block 0 and
re-copy the driver program to C:

This won't work: Timeworks normally doesn't get on with NVDI at all. Or
SpeedoGDOS for that matter (it's not that keen on FontGDOS either - it's
only really happy with 1.1). There was once a patch available for making
v.2.0 work with Speedo or NVDI and vector fonts. Didn't work with 2.01
though, IIRC. Annoyingly picky program all round!

The chip inside the ST (which I think we were talking about) is an AY-3-8910 or compatible. It has three tone channels which can only have a block waveform and cannot be recombined with each other. In addition it has a noise channel (or three, depending on how you look at it). About the only thing that's 'dynamic' about it is the envelope system which can change the volume in certain pre-set sequences.

The same chip is used in the Amstrad CPC, the Spectrum 128K+2 (why not just 130K - never got that...), the MSXes, and a wide range of other machines.

Later Atari models had a different chip (starting from the STe I think), of which I know absolutely nothing. However, I do know that the typical Atari sound most people will know (either from earlier experience or from Atari-ST game music that is available on the net) was produced by the AY-3-8910.

It wasnt a patch as such but a replacement Fontwid program. The problems
with NVDI, SpeedoGDOS and FontGDOS were all due to the WID files not being
recognised.

Nothing make sense... What you mean under 'boot' ?
Btw. it's not necessary to start AHDI from AUTO folder. You can start it
simple by mouse click after system startup.
However it looks that you have corrupted system on your drive - or
hardware failure. You need some expert to look at it .

PC GEM used dithered blue as a default. Either way, desktop
defaults are a pointless comparision argument.

> Don't compare the AmigaOS with current OSes. Workbench was
> and is very fast, even with an 8MHz 68000.

By the same token, don't compare Workbench with the GEM found
on TOS 1.0, otherwise the argument is mute.

If people are gonna mention AmigaOS 3.5, they might as well
compare it to MiNT 1.15.5 with N.AES 2.0 and Thing 1.27, current
version against current version.

MiNT (despite the "MiNT is not TOS" slogan) is actually a GEMDOS
replacement. Below that, you still have BIOS/XBIOS and above
that the standard AES.

> However, the above combinations that you describe, don't
> sound very much like an ST at all.

MiNT just adds multitasking and abstract interfaces a la UNIX to
GEMDOS, while N.AES is a much better version of MultiTOS. Thing
is also a desktop that is ages ahead of anything Atari ever made.

> So if you class MiNT as still essentially an ST then
> obviously TOS is not the core.

It is. See above.

Yeah. :) The wars were fun. But we're all now the 'underdogs' I think
that gives us more of a sense of commonality. ...Or maybe it's just a
common hatred of Bill. :)

> Besides you should try the CPC/C64 debate thats just as good.

I bet it would be. ...Always had a c64 meself. The cpc was a powerful
beast... Just too late in the 8bit era.

> However all this begs the question: Who were the bigger idiots
> Commodore or Atari? Both died miserably thanks to some pathetic
> mistakes leaving us with the awful (spit)PC/Mac homogeny that we have
> today.

I think Commodore has to take the cake for most braindead company
trying to market some brilliant hardware.

When Atari were happily selling their ST to the home users for the
games market (as well as the professionals), commodore would still
swear blind that theirs was a *business* machine.

Actively discouraging developers who were part of 'games' companies
was just stupid, considering how well it was selling for precisely
that purpose. ...It's no wonder they managed to screw up so royally.

Even as a devout commodore fan all my life (vic20 -> c64 -> a500 ->
a1200 -> a4000) ...I still feel it was a shame the Atari Lynx never
became the huge success it should have. ...That's got to be the
best wee hand-held console of that era.

Any Atari users care to share their perspective on why Atari
failed so well? I didn't get to hear much about what happened to
them on this side of the world.

Nathan.

I bought my Atari in 1985 when the choices were: an 8 bit machine (the writing was well and truly on the wall) An Amiga 1000 (too expensive) a Macintosh (way way too expensive) an XT with hercules monochrome graphics and one single sided floppy or an ST with colour screen and one free standing fdd with gigantic 500kb storage capacity. Of course I bought the ST and got the best technology for my budget. The ST was a fun machine and useful. I wrote a 300 page thesis on 1ST Word + and a dot matrix printer.I had it for six years but development never lived up to the Atari hype. Every year there was always something new that was announced long before other marques had it but it somehow never materialised. Some of the serious business software was not very good, although it was comparitively cheap. Support from the dealers or from Atari Corp was pretty much non existent. You had to depend on the local users' group, which wasn't such a bad thing, I suppose. But you had to be loyal to survive, and that's what fuelled the great Atari/Amiga rivalry. Eventually the frustration level was too great and I succumbed to the lure of dull but dependable Windows computing. Until last year when I found an old STE in a garage sale....

I guess the root sector or a boot sector of his drive contains bad data.
If this is the case re-installing a driver won't help since you can't
recover the partition information that way.
In case partitioning was done with HDDRUTIL it's easy to repair the root
sector with the function provided for this case. Otherwise you have to
use a disk tool like SED or DISKUS or whatever to repair the damaged
data.

I'm getting extremely confused. If the computer boots from the hard drive,
then there can be nothing wrong with it!

>John, you mentioned earlier that you wrote a program called HDDRIVER7?
> Would this program help me? Where may I find this program?

John didn't write this program, Dr Uwe Seimet did. I suggest that you try
the suggestion that I posted a day or two ago and download the demo version
from his web site to try. At least it will allow you to boot your drive,
although (being a demo) it does have some restrictions!

In case you have a mega ST and a VORTEX hard disk, this problem is quite
common: the HD will disable some ST's from booting up, especially when
there is more than one HD connected. If this is the case, you could try
to bootz up again anda again, or to use another ST with a stronger power
supply, maybe.

> Any Atari users care to share their perspective on why Atari
> failed so well? I didn't get to hear much about what
> happened to them on this side of the world.

Here's my perspective on Atari Corp.'s failure:

1) complete lack of marketing.

When Tramiel was working for Commodore, they released the PET and were flooded with interview requests because this was one of the first "powerfull" personal computers.

Their mistake was to assume that because you manage to innovate once, people in the industry and press will automatically want whatever you come up with next.

The MEGA/STE, TT and Falcon are all fairly capable machines, but neither of them got developped to their full capability on the market, because Tramiels never understood what marketing meant. In fact, they downright never knew at all.

A good example of this:

The TT's release was abortted 3 times; once because of FCC approval problems, others because of lack of planning. By the time it came out, the motherboard had changed layout 3 times and, oh surprise:

- what is this TT-like box with an SM147 display on it?

- Ah yes, that's our baby the MEGA/STE. The Tramiels just sent us one for show before today's demo. No idea on the specs; just turn it on and tell us how many you wanna order.

2) lack of focus: sometimes a game console company, sometimes a personal computer company.

Because of this, neither the Falcon nor the Jaguar never were half of what they were meant to be on paper; both ended up partially brain-dead designs.

The same mistake got the TT not even half the credit it truely deserved. They promised a really good networking machine, but cancelled the UNIX port before it matured. Then, they were supposed to produce all sorts of interresting

VME devices, but canceled Atari Germany's own attempt (the
Riebl Ethernet card) at the VME game and layed off the
division's president for trying to emphasize the computer
products when the Tramiels had just decided to focus on
the Jaguar exclusively.

They should have split the company in three: computers, game
consoles and a common R&D that creates the custom chipsets.

3) personal dumbness.

The Tramiels were never geniuses, but refused to admit it.

a) They kept on closing, then opening, then closing again
several national divisions, based on their mood of the
moment.

In Canada's case, they once considered that it warranted
its own division, then perhaps it should that Canada and
USA should be merged into North American division, then
again not and it might be a good idea to create a distinct
Atari Quebec to cather the francophone market. Oh, fuck
that, Canada is not profitable enough, let's close it all.

b) reverse merger with Tandon (JTS).

That whole idea came out of misplaced jewish family
spirit, because Tandon was toghether with Tramiel in the
jewish getto during World War 2, so when JTS got into
financial trouble, Tramiel merged (a then profitable)
Atari with JTS to help balance JTS' debt, as a personal
favor to his old friend.

In a nutshell, Atari had the right development team, but really
crappy management. That's why Atari computers failed, except in
the music industry where anything with MIDI ports was an instant
universal best-seller, back in the 80's.

I reckon the web is the best source of windows downloads. There's a
site called synthzone that fairly extensive and should give you some
good links. I don't have the exact URL with me, but try
www.synthzone.com (it may work)

> 2) Might anyone in this newsgroup have an opinion on Windows software?

Yes, but it's unprintable. Seriously though, its probably ok, just a
bit bloated and frustrating.

Cheers, Simon

I don't think that anyone could seriously say that the Atari ST wasn't inferior technically when compared with the Amiga. What it did have going for it however was it's far more reasonable pricing, meaning that a lot of people moved to it instead of the Amiga in the early 16-bit days. This ensured that it got most of the new original 16-bit games, and the Amiga had to make do with shoddy porting jobs that did not take full advantage of its custom chips.

However, when games like Kick Off (with its full overscan) and Shadow Of the Beast (with multi-layer parallax and copper list gradients) came out, people began to sit up and take notice, and the Amiga became more of a 'must have' type of machine. It also started to excel in applications software.

And the rest... is history! It overtook the ST (thanks in part to dodgy Atari business practive) and reigned for a while before it in turned was stomped by the PC (thanks ENTIRELY to dodgy C= business practices).

This is also from a UK/Europe perspective, I'm sure in the US it was different.

PhotoLine does a decent job as does ImageCopy. ImageCopy can print
without NVDI and contains internal color management tools. The last
couple of versions of NVDI contain tools to adjust most Ink Jets.
PageStream and Calamus produce decent output as well.

Hi all,

Fresh in this month is the English RSC file for Durs Lochar's Phototip utility. If you've got a digital camera you need this utility (formerly Olympia), to grab images from it, create catalogs and far more.

Web site for the translation in sig, grab the utility itself from:

http://melkor.unibe.ch:8080/evtheol/durs.lochar.1/personel.html

Not, not anymore since that would not work for new hardware like Milan
PCI SCSI. Current versions of DISKUS use the SCSI Driver interface which
makes DISKUS more flexible and provides the complete functionality for
any hardware.

I am sorry you are still not sorted out. I have had no difficulty in by-passing the hard drive in the past.

You have to have a floppy with your HD driver program on it in Floppy Drive A. (I use AHDI.PRG for this and will send it to you by email if you want.)

When the access light goes on you press the ALT key, and when the light goes off you let it go. You might have to do this two or three times. You should then get a screen showing A and B and a trashcan.

Open A, click on AHDI.PRG and it installs whatever it installs. You then have to create a Drive C from the desktop, click on this and you should have access to your hard drive AUTO folder.

If you cannot access Drive C then there may be a problem with your hard drive or the connection.

Bad move. PCs have very bad MIDI timing, generally because while you are
making music, the PC is doing all sorts of useless things, like checking for
virii, swapping RAM, listening to com ports, driving the sound card, Direct
X and all that crap.

You'll also be looking for an expensive MIDI interface.

Hi Derryck,

Thanks for the drivers!

On 21 Mar 2000 17:17:02 , atarigalen wrote:

Slight problem. While they do support the deskjet 600 they don't work under MagiC! I have got them to work under single-TOS but they still send the reset code to the printer. I need to make the small mods to the source provided my SoftLogik and then assemble it - but I'm still short an assembler. Are there any assembler programmers out there?! ;-)

Thanks,
Jerry

Ofcourse (although I know very little about the Atari myself).
I was mainly replying to Mr. Cracknell, who said that:

"Sure the Amiga could multi-task, but let's face it, an 8MHz 68000 with 1 meg
of memory isn't really going to multi task that well anyways. It was slow and
crashed a lot."

This doesn't make much sense when you look at todays Amigas (or almost any
older Amiga as well).

> version against current version.
Which I wasn't doing.I never said anything about OS3.5. I said "Workbench was and is", indicating that I was talking about *any* version of the AmigaOS including 1.2/1.3. And I wasn't comparing it against TOS anyway. The previous post indicated that because pretty much any other multi-tasking OS would run awfully on an 8MHz 68000 then Workbench was the same which is simply not true.

Are all ST owners so deadly serious. ;)

Hi there,
anyone any tips on how to share an SLM 605?
I'v got a TT030 and a Mega STE.
It would be (more than) nice to use the laserprinter without having to
switch cables (and reboot)...

Thanks for any tips...
Atari (hopefully) for ever...

"It sure is" is hardly a conclusive argument now, is it? It's simply not an FM chip. Discussion does not indicate truth. If it was FM, it would have sounded more like Megadrive music, and consequently I'd have a bit more respect for it.

I posted an extract from the actual Yamaha chip manual. If you can point me to alternative information then my mind will be changed. Every piece of ST music I've heard is either samples or that awful square wave cacophony.

I have owned a Falcon and also have owned an A3000@50mhz. Ok the Amiga was faster somewhat, but compared to MiNT, amiga OS3.1 sucks! MiNT is a far more superior operating system. There is NO DOUBT in my mind. I think Linus T. would agree :)

Lack of development, too little and too late. The Falcon was what the STE should have been. Then all of a sudden, just as it was being launched, the Tramiels decided to stop developing the Falcon040 to concentrate on the Jaguar.

Lack of vision, the Tramiels failed to see the professional market of the machines. Germany (where the Ataris were most recognized as pro DTP workstations, and sold like hotcakes) is a long way from Sunnyvale. They kept on aiming the "home computer" market, when everyone was buying PCs to have the same computer at home as they had at work. The Jag was aimed at market they had been absent from for a decade and was already completely saturated with offerings from the Japanese console makers. Of course, with no marketing it was a flop.

Lack of marketing. The ST range was a huge success but I can't recall ever seeing any advertising for the Falcon. They were actually selling them to developers and magazines, so there were no reviews. This was all even more inexcusable as they had committed exaclty the same errors with the Lynx.

Timeworks does indeed use GDOS and it works very well with NVDI 2.5
running at the same time and is surprisingly quick. Timeworks flatly
refuses to work with later versions though.

Is there a newer TCP than 1.33?

I don't get bombs though, I'm using a utility that traps them and gives an error message, which also sometimes enables me to carry on working without rebooting (though I do lose the program that caused the bombs).

>James, just to test whether it is the OVL can you test the site with
>Olivier Booklages OVL too (version 5.68) and see if you still get the
>crash. I have the same software setup as you - but I have an STe and STfm.

I've just reinstalled Olivier's 5.68, and guess what? The DHS site works fine with that. Also too whilst I was there I downloaded a new demo, and the Cab Download module is working again! :)

So it looks like that Dan's has some bugs somewhere, and I reckon that his OVL has also caused the blockage to the Cab Download module too.

I must say though that Dan's is the only one of the two to allow access to eGroups/Onelist's site (cookie problems otherwise), so don't say that I'm against his OVL!! ;-))

Thanks for helping me through this! I haven't found anything that says
"Patch" in MT Pro though.

Also, the demosong plays correctly if I start it at measure 2. Starting
at measure 1 causes a drum beat to be played. Any ideas?

On the plus side, I am able to record just fine!

Nicholas,

Well, if I'm dedicating this machine to MIDI work:
- there wouldn't be any virus scanning software on it
- since it has 64 MB RAM, I could turn off the virtual memory
- I can disable the COM ports
and
- it already has a built-in MIDI interface, so there's no expensive
interface to add

All I need is some software...and I think I have CalkWalk around here
somewhere. At least it would be a 'starter-system' to get me going. I can
always 'upgrade' to an Atari later.

I can see I've opened a can of worms mentioning a PC in an Atari group, so
I best duck and run...VERY FAST.

Forrest

O.K., let's start at the beginning.

#1 -- does your modem work? Send it some ati# commands (with
different numbers for #). Consult your manual for their
meanings.

#2 -- get rid of conflicts. Remove anything on your HD that
might possibly be STiK or STing. Then get a new copy of STing
unarchived.

#3 -- Place HSModem7 in your auto folder, using ONLY the
appropriate .PRGs.

#4 -- Place STing last (or near last) in your auto folder. Put
the .cfg file next to it and edit it so that it points to the
STing folder correctly.

#5 -- Put only the main .CPX in the cpx folder. Don't bother
with the other two.

#6 -- Log on to your provider to find out what script you need.
You can run DIALER.PRG to alter the script.

Then tell me what happens.

Galen

atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with NewsGroups.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-
Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at
http://www.atari.benjamin.net And Jump to my FTP site linked to my Web
Site so you can Download Free Catalogs or FTP directly to my site at:
ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way,
Feel free to Request catalogs through E-Mail. Really, it's not an
inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both!
Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail.
Please let me know if I can attach text files to your E-Mail. Catalogs
are just regular ASCII text files so you can download them into your
text editor and view them, edit them or print them out! It would make
things easier for me if you take my Catalogs, load them into your text
editor, delete what you don't want and E-Mail me the rest! To expedite
things, include your complete Mailing address so I can figure your
Shipping/Postage & Handling. I'll be back after the weekend.

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. So checkout what's new on
my WebSite. In Fact, check it regularly as my Catalogs are updated
regularly. Customer's are served, first come, first serve! I have 6
different Catalogs, and my SoftWare Catalogs are my largest. They have
the biggest Byte Count. You should see my inventory! I have TruckLoads
of HardWare, Boxes & Boxes of Software & Libraries of Books & Reference
Material for the Classic Atari 8 Bit & Atari ST! And remember, if you
can't come see me today, come see me tomorrow!

> I have never used the Atari myself, but seeing how good the C64's audio
> was, I wouldn't be surprised if it was superior to the Atari's.

The c64's audio was way better than the Atari's. (But the Atari's
68000 horsepower allowed for some interesting tricks.)

...I think the whole idea of the Atari's sound was that it was basic
in the stock model, but *expandable*. ...That's why it did/does so
well in the music/audio scene - it had all this beautiful MIDI capability
hiding under the hood.

Of course, many games would only support the stock configuration, and
thus lost out on those advantages. But for the pro user, sound was a
beautifully expandable thing.

...I only ever had an Amiga myself, and love the built in sound chipset.
(Though it is a bit limited by todays standards.) ...But I don't see
the point in arguing about which stock configuration was better, since
the Atari's were designed in that respect with expandability in mind.

But I still just had my c64 when everyone else was upgrading to their
Atari's and Amiga's... So I was just in awe at them both. :)

Nathan.

I just have to interject here. (even though I hate these sorts of dead arguments -probably because I can't stop myself from replying!) The stability of the OS is not in question. The OS itself was and is very stable indeed. Problems arise with badly written programs. If you're multi-tasking 10 things at the same time then obviously there's at least 10 times more chance of a crash than if you're only running one single task. Quite frankly, I prefer the option of being able to run 10 things at once if I wanted to than to be stuck with one thing at a time. And as far as features go, there simply no question of the superiority of the Workbench over GEM. What mutant chose primary green for the initial background colour? :)

> Sure the Amiga could multi-task, but let's face it, an 8MHz 68000 with 1
meg
> of memory isn't really going to multi task that well anyways. It was slow
and
> crashed a lot.

Sounds to me just like "yeah well, I never wanted to play your stinking game anyway". ;)

Don't compare the AmigaOS with current OSes. Workbench was and is very fast, even with an 8MHz 68000. Just because current multi-tasking OSes are slow and bloated and need massively powerful (in comparison) hardware, does not mean the AmigaOS was slow on a relatively slow processor. It certainly was not, and only crashed if it was pulled down by some evil program. It certainly wouldn't crash for something trivial like disk corruption. It would tell you that the disk was faulty.

There. Said it. And I'm annoyed at myself now for getting sucked into something that should really be on the advocacy groups.

You have no experience of C64 sound do you? :) Or of Atari ST sound apparently.

The SID chip has Saw, Sine, Noise and variable pulse width waveforms. You can also combine waveforms so you can logically AND a noise and a saw together for example. It has low pass, band pass and high pass resonant filters (and also allows a notch filter by combing the low pass and high pass), along with ring modulation and hard sync. It was designed by Bob Yannes who went on to co-found Ensoniq.

And where on Earth did you get the idea that the ST chip had FM on it!?!?!!!?!
It's certainly not a 4-operator FM chip.

Here's an extract from the Yamaha manual for the YM2149 chip which is pin compatible with AY-3-8910 manufactured by GI. (SSG stands for Software-Controlled Sound Generator):

All functions of the SSG are controlled by the 16 internal registers. The CPU need only write data to the internal registers of the SSG. The SSG itself generates the sound.
Sound is generated by the following blocks:
* Music generator: Square waves having a different frequency are generated for each channel (A, B, and C).
* Noise generator: Pseudo-random waveforms are generated (variable frequency).
* Mixer: Music and noise output are mixed for the three channels (A, B, and C).
* Level control: Constant level or variable level is given for each of the three channels (A, B, and C). Constant levels are controlled by the CPU, and variable levels by the envelope generator.
* Envelope generator: Generates various types of attenuation (single burts attenuated and repeated attentuation).
* D-A convertor: Sound is output on each of the three channels (A, B, and C) at the level determined by the level control.

The CPU can read the contents of the internal registers with no effect on sound.

No mention of FM anywhere. Merely 3 Square wave channels and a noise channel, all with envelope generators. With a bit of clever programming you can get samples out of it, but that's it.

->
->so what do you prefer to compare?
->
->i would assume this as being fair:
->
->Amiga 1200 - Falcon 030
->
->the gfx hardware:
->
->both machines have bitplane modes up to 8 planes, the amiga
->is much more flexible here, allowing anything from 1 to 8
->planes, while the falcon only allows 1, 2, 4 and 8. the falcon
->still has no scroll registers and has a hard deal moving all
->8 bitplanes.
->
->also annoying is that the falcon only allows 6 bits per color
->gun in the palette while the a1200 allows all 8 bits, so the
->total amount of displayable colors on the falcon is max 262144
->and on the a1200 it's 16777216.
->
->both machines offer a special graphic mode which is different
->to that bitplane stuff. the amiga offers the HAM mode which
->has a lot of color restrictions and is only useful to display
->pictures. the falcon has the 65536 color mode which is very
->nice but also has a heavy dma load.

My understanding is that the 65k mode on the Falcon is the
fastest mode. It blows 256 color mode away, from my personal
experience.

->at the time i was very annoyed that the amiga 1200 didn't offer
->a hicolor mode as the falcon, but you can "fake" a similar

->mode with ham so you get a 262144 color mode.

SuperHam is nice, but slow...also like all HAM modes on the
Amiga, it suffers from "fringing".

->for the special hardware features the amiga offers some things.
->first there are the sprites. sometimes they are nice but mostly
->you can forget about them.
->
->what the falcon (and also todays PCs) really lacks is the copper.
->with this small processor you can configure your display freely
->without using interrupts and similar hacked stuff which mostly
->kills different machines.
->
->the blitter:
->
->the blitter of the falcon is still a joke, nothing compared to
->the very flexible blitter of the amiga. the only things it
->can do is to copy memory and fill memory...
->
->the amiga's blitter is much more useful, it has 3 sources
->and 1 destination, a lot of masking registers, a not-so-very
->useful fillmode and is able to draw lines to bitplanes very
->fast.

Correct me if I'm wrong here, but in an interview with
Thalion Games, they stated that the blitter chip on the
A1200 was basically brought over from the A500 unchanged.

While the Falcons blitter does run at 16mhz...not 8. (or
7.14 as it were).

->well, the blitter is not of use that much since both computers
->have fast enough processors.
->
->while we are at it: the processors.
->
->the falcon has a 68030 running at 16 MHz, the 1200 has a
->68020 at 14.xx MHz. the difference between 020 to 030 is
->very small, all opcodes execute as fast on 020 as they do
->on 030, the data cache of the 030 is only of use with
->very fast ram which neither the 1200 nor the falcon has,
->so here it's almost equal... almost, if the 1200 didn't
->have support for 32 bit ram. okay, in most cases you had
->to buy a small memory card but it was worth it. the 1200
->nearly got 4 times as fast as without fastram, without
->processor upgrade. i have heard of fastram cards for
->falcon, but at the time i owned a falcon no programmer
->had taken notice.

Why don't you mention the A1200's 2 meg chip ram limit? Also,
no built in clock, no SCSI, no hi-density disk drive as standard,

no MIDI, and you've not even touched one of the Falcons strongest
co-processors, the DSP chip. (also, it had a socket on the MB for
a math co-procesor - just plug one in).

Did I mention the built in LAN port yet? ;-)

->the OS:
->
->atari has put two os's to the falcon package: TOS and MultiTOS.
->the amiga comes with AmigaOS 3.0.
->
->i'm sorry to say this but here the amiga definitely kicks the
->falcons butt. TOS is a weak attemp of doing a graphical os and
->lacks multitasking, multitos doesn't lack multitasking but is
->still a very weak attemp.

MiNT and Magic both address this argument very nicely. ;-)

->amigaos 3.0 has a lot of features even linux or windows still
->dream of like true datatypes, localization support etc.
->
->
->what i didn't talk about yet was the falcon's dsp. a (for that
->time) very fast processor without a proper memory interface.
->it carries 56K of memory, but is a bit difficult to reach from
->the 030's side of view. you can do some demos with it, but in
->every days life you can just forget it.

Ah, glad to see you did finally bring it up. It is supported by
a lot of software... ;-)

->i'm sorry, all in all my choice remains the same: from those two
->machines i definitely choose the amiga as the favourite system.
->
->and before anyone cries: yes, i owned a falcon (it got destroyed
->when the flat of some friends burned down) and i also programmed
->stuff on it. still, the hardware AND the os of the amiga is better
->designed.
->
->Graham.

For the record, I owned an A1200 for a while. The Falcon was
superior in hardware (stock). I did feel that the A1200's OS
was more sophisticated.

> Amiga still is a good game coding machine. However, Atari is
> better at serious applications such as MIDI and DTP.
This is pretty subjective really, but as far as MIDI goes, the ST was more widespread (you didn't have to pay the extra for a MIDI interface), but certainly not better. Cubase, for example, is a pile of cack. Always was and by the looks of the way PC and Mac development is going, always will be. VST is just the same old featureless rubbish with software FX bolted on. The MIDI support itself is very basic indeed. Amiga MIDI software (well basically I mean Bars&Pipes) is still very advanced for MIDI sequencing so you could hardly say the ST was better. But this is a pointless argument anyway. If what you have got does the job you need then why change it? As to DTP, the Amiga had/has some pretty vast DTP packages, so again the more widespread argument again applies.

> However, if you take a well-equipped TT, Hades or Milan running
> N.AES over MiNT, it measures up rather well against any Amiga.
Is that really an Atari though?

Let's change this discussion. I would say that my Amiga, while being far beyond the power of the old Amigas, is still very much an Amiga in every way. However, the above combinations that you describe, don't sound very much like an ST at all.

Now I know this has been covered by the Amiga community before with very varying results, but let's try it on the ST...

What makes an ST an ST? I say that because MiNT, as it says in the title "is Not TOS". So if you class MiNT as still essentially an ST then obviously TOS is not the core. And beyond the OS there's really not much else. It's basically just a processor. So what defines it to be the computer it is?

Thoughts if you will....

And may I suggest that any further posts are taken out of comp.sys.amiga.games.

yes it is, as it still runs amigaos and it still runs all the programs
written for amigaos.

Graham.

Hi James,
I've been to the new dhs site (dhs.nu) several times with no problem at all. In fact, the page loads relatively fast compared to some. (ie Mine :-)
Anyway my setup:
Cab 2.8/I-connect 1.7/STip/STip CAB.OVL
Ben

Sent via Deja.com http://www.deja.com/

i've got a chance to grab a 520ST for $125... is that a good price?

i'm very "PC" literate, but don't know anything about Atari although I had an old 800XL when I was a kid. if midi on the atari is really as great as everyone on this group claims, then i was thinking of using this atari for sequencing and dedicated my PC (gasp) for digital audio. (assuming that i can sync these up okay) ... sound feasible? any guidance you might offer to someone getting started with atari?

I thought this argument was about what was better, the original 1040ST or
the original Amiga A1000.

And I still stick by my guns and say that the original ST had a much
more stable OS than the original A1000 with it's damn Guru Meditation
errors everytime you just looked at the thing funny.

Falcon, TT, Milan, Hades. I don't care what you say as far as I'm concerned
only the ST is an ST. The others are different machines that just happen
to retain a certain degree of ST compatability.

What sort of Atari is this? It should connect at 19Kbps unless you omitted
to set the serial.cpx.

Are you sure you have set STinG to Active in the STinG.CPX? Which version of
STinG are you running?
What message do you get?

A bit expensive for a bare system. If it has been upgraded and comes with
software, a monitor and double sided floppy drive, I guess it's OK.

> i'm very "PC" literate, but don't know anything about Atari although I

That's a good idea. That way you use the ST as a MIDI clock generator too.
Your PC software must be able to sync to an external MIDI clock. VST,
cakewalk and most others do.

> (assuming that i can sync these up okay) ... sound feasible? any
> guidance you might offer to someone getting started with atari?

The problem nowadays is getting the software. Cubase and Notator are pretty
hard to find nowadays, and pirate copies don't work reliably. Also most
sequencers require at least 1Mb of RAM, that a bare bones 520ST doesn't have
(512K) unless it has been upgraded.

You forget to mention that only an Amiga 1000 is a real Amiga.
Anything with a 020 or PPC (or anything else than a 68000) is
not; it just happens to have retained the same trademark.

> Jaguar.
Sounds scarily familiar. Exactly the same in fact - lack of
development, too little too late.The A1200 was what the A600 should
have been. (The A600? biggest pile of crap Ive ever seen) And in a
small way, Commodore did the same thing in the end as it dropped the
A1200 to concentrate on the CD32 (Another pile of crap). And what was
worse was whilst Atari had once had experience of success in the
console market those idiots at C knew diddly squat! It makes my blood
boil! I remember thinking the CD32 was ridiculous at the time- an
Amiga console? I thought the whole point of the Amiga was that it was
a computer that was cheaper than a PC but being one could do more than
a console. Then again it would seem that it was just history repeating
itself. From what I've read about Commodores earlier exploits they
were always bloody hopeless. Like the Amiga they overpriced the C64
upon its release and it only became a success when they lowered the
price - remember that C had whopping great losses in 1989. When they
did lower the price sales rocketed along with the profits for 90/91
and the Amiga then finally beated the Atari beacause the price was now
comparable and everybody knew the Amiga (thanks to games like Beast)
could do more in graphics. And the CD32 wasn't the first failed
Commodore console, C released a console version of the C64 (just as
the CD32 is a A1200 with a CD drive) and it also failed miserably.
Those idiots just never learnt from their mistakes! (CDTV anyone?)
Arrrrrrrrgh!
> Lack of vision, the Tramiels failed to see the professional market
>of the machines. Germany (where the Ataris were most recognized as pro DTP

>aimed at> market they had been absent from for a decade and was already
>completely saturated with offerings from the Japanese console makers. Of
>course, with no marketing it was a flop.
Wasn't the Jaguar also not truly 64 bit? It like the CD32 also lacked
any killer titles to save it. That and there wasn't that many anyway.
At least the Saturn died with them (as the Dreamcast will too as the
PS2 will most likely kick its arse into submission)
> Lack of marketing. The ST range was a huge success but I can'trecall
>ever seeing any advertising for the Falcon. They were actually selling
>them to developers and magazines, so there were no reviews.
Sounds oh so familiar again, Commodore completely failed to market the

A1000/500 properly stating that people would come to them without major advertising (somehow) - the idiots. As such no-one was aware of the platforms potential they just dismissed as another gaming platform and stuck with their two colour (spit) PCs despite the fact it was WAY inferior.
>This was all even more inexcusable as they had committed exaclty the >same errors with the Lynx.
Great shame, I knew two people who owned a Lynx (a miracle) and I have to say it was so much better than the Game Gear and the Game Boy.
So what were the differences between the ST and the STE? (seeing the Falcon/A1200 have already been discussed) If any Atarians (Is that the equivalent of Amigans?) are bothereed the A600 was an A500 with the slightly faster 68010 CPU (about 1.5mhz more? laughable!) a smaller motherboard and thus size, 1mb RAM as opposed to 512kb and was way more expandable allowing a higher ram expansion and an internal hard drive. If anything the A600 was what the A500 should have been in the first place! Anyway, what set the STE apart from the ST?

This is a bit off-topic, but:

There are quite a few different varieties of 4-op FM. The one in my
synthetizer has 8 different waveforms, and each operator can use any
of them. This gives far more possibilities than the sine only -
approach, because you don't for example have to use several operators
just to get a square - like wave to use with other operators. Although
whether it's better or worse than 6 operators still depends on the
sound you're trying to get out of the machine... (well, FM
synthetizers usually have more features than the (old) soundblaster
ones anyway, like DSP for reverb, echoes and such stuff, pitch
envelope generator, LFO, filters etc.)

But I'd take SY99 or something like that gladly, it combines the
greater number of operators, ability to use samples in operators and
several other nice things. ;)

When I say reigned, I mean in the "Amiga in every home" sense, not in any business sense - the crappy old PC had that sown up from day one.

Commodore had no cohesive global strategy. In the UK, they sold loads of Amigas as games machines, in the US they were targeted at niche markets, like video production.

Believe me, the arguments have absolutely RAGED in the Amiga groups over
the years as to what makes an Amiga. It's generally deemed to be the OS,
but there's still a few custom chip advocates.

And it has mutated now into "Will the new Amiga really be an Amiga?"

I just philosophically avoid the question and say "It's a state of mind" ;)

> both machines have bitplane modes up to 8 planes, the amiga
> is much more flexible here, allowing anything from 1 to 8
It thought it "only" allowed 1,2,4,5,6,8 (6 being a "trick-in-some-way"
5-bitplane mode)... Anyway IIRC it also had two layouts of
plane-interlacement...

> planes, while the falcon only allows 1, 2, 4 and 8. the falcon
> still has no scroll registers and has a hard deal moving all
What do you mean by scroll registers? Since the STe hardware scrolling is
possible!

> 8 bitplanes.
Apart from the 16-bit data bus access, I cannot see any reason why it
should be faster on a bare 1200. And one does not always do linear
memory-accesses...

> pictures. the falcon has the 65536 color mode which is very
> nice but also has a heavy dma load.
Better than doing C2P conversion IMHO! :)

> very small, all opcodes execute as fast on 020 as they do
Some are faster (muls IIRC). And you have got a nice PMMU within! :)

Interrestignly enough, I gave another try at the Falcon yesterday
and I could not agree more. For what it's worth, I would prefer
an STE with Mario Becroft's IDE interface to a Falcon.

At least, this TT is a real computer. No wonder the NASA bought
several of them, back then. ;-)

The same for Atari.

The ST was sold as a generic computer. Of course, the main
customer response came from DTP and MIDI markets, but overall,
Atari did far better in Europe than in North America.

In America, the only market they "tried" approaching was the MIDI
market, through full-page adds in Electronic Musician.

I don't doubt it. ;-)

That was just my sarcastic reply to another poster's "an ST is an
ST only if it is the original ST (not an STE, MEGA or clone) and
that has always been worth shit" dumbass attitude.

"Thomas J. Andrews" <taj16@dreamscape.com> wrote in message news:sdckml20lul128@corp.supernews.com...

: I appreciate all your comments and suggestions, but they bring up several
: more questions. The consensus seems to be against inkjets, mostly because
: of the cost of ink carts. The President of my old user group used to
: create newsletter pages on his Deskjet 500 with an STe, and they compared
: favorably with those created by the former owner of my SLM804. He used to
: claim he refilled his ink carts and the refills cost him just pennies each.
: Doesn't that work any more? I see ads for refill kits in the back of
: Computer Shopper, so you'd think it was at least possible.

Refill is not a good idea. The ink is cheaper and runny when moisted, it also appears to clog the cartridge. The refill process is messy and you'll be having black fingers for several days. My old DeskJet 500 was a better printer than the Deskjet 540 I'm using now. This bastard doesn't want to grab the paper for loading. It also self-destroyed itself by somehow breaking a plastic lever inside.

Today I'd buy a laser, preferably able to print on thick (padded) envelopes.
I will stick to HP, since these are directly supported in Solaris, which I use.

You still got that interview somewhere?? And I think you might be
correct in saying the AGA blitter is functionally the same as the ECS
version.

>
>Then you could take just the ST and leave the monitor at home.
>That would be REALLY handy.

I have considered this, but decided it would be a bad idea. What if
your computer locked up for some simple reason like accessing a menu
for instance. And you couldn't fix it because there was no way of
knowing what waws going on.

Maybe a VERY dedicated program that had no user interaction other
than inserting a disc and pressing the occasional key. But I don't
think anyone would write such a program due to it's very limited
appeal.

A good compromise would be a prog that runs in medium resolution,
then you could take a small, beaten up, B/W television instead of your

nice high res monitor. Then you could have a bit of visual feedback (To change song order for instance).

Why not join the midi-atari mail list, just send a post to:

>i've got a chance to grab a 520ST for $125... is that a good price?

I'm from the UK, so I have to convert... about 90 UKP. This is not bad, but you could haggle for less.

Things to consider:

How much memory has it actually got? It may say 520 on the box but has it been upgraded, a lot have.

What model is it? STF, STFM, STE? The STE is the best bet as it is easy to upgrade the memory. There's also an internal IDE drive interface avaliable for it (using the 2.5" drive). But the other models are ok.

Is there a high-resolution monitor availble with it? This is desirable (but not essential) for most midi work.

>
>i'm very "PC" literate, but don't know anything about Atari although I

The setup you've described is probably the best. Atari's sequence great and probably better than the PC. The PC will be best for digital audio - triggered by the atari.

Join the atari-midi mailing list for some good advice. Send an e-mail to:

atari-midi-subscribe@onelist.com

V50 actually ;) But it's a rather close cousin of TZ81Z with a few
added features in synth side, built-in drum machine and sequencer
etc. One of first workstation - like synths.

I think Nicolas ment to say "SLIP". If the ISP does support SLIP - STiK works very well.

There has been a lot of development with STinG and a number of different versions of the core module. Some of the STX modules will have problems if the core program is to old.

The Amiga version of CSB was first published by FTL and then re-
published by Psygnosis. The PC version of Dungeon Master was published
by Psygnosis (dunno if FTL ever published it), and I am unsure if a PC
version of CSB was ever done, well I havnt got it :^(

:)

Hi there!

I use both PC:s & Ataris for my music, I compose both on the PC and the
Atari, but for mastering I only use my F030, even if you disable everything,
have lots of memory etc the timing of the PC is quite bad. (But my PC is
protable) To get best timing on the PC, use an old 16 bit version of Cubase
(v2.8 - 3.0 works great) NOT VST, and run it in Windows v3.11.
Good luck!

>5-bitplane mode)... Anyway IIRC it also had two layouts of
>plane-interlacement...

Amiga allows any 1-8 for AGA and any 1-6 for ECS as the previous
poster said, whoever he is. You might be thinking of ECS halfbrite
mode where the 6th plane was a flag, changing the brightness of that
pixel, from normal to half as bright. So you couldn't quite use 6
planes for just any colors, but could use it for any 32 colors, plus
the half-brite versions of those 32 colors. Since AGA allows *any*
selection of 1-8 planes for color lookup, half-brite mode doesn't make
any sense on AGA.

Then there was HAM, 2 bitplanes are reserved for determing which 1 of
the RGB values from the previous pixel to modify for the current pixel
while holding the other 2 RGB values the same as the previous pixel.
Hence Hold-And-Modify, HAM. Hope the HAM description was correct. In
AGA HAM you can have any 64 base colors, 6 planes, the other 2 planes
are reserved for the HAM flags. On ECS HAM you would have 16 base
colors.

In that case, we've misunderstood eachother. The post you originally replied to
mentioned Falcons and A1200's, so I assumed that you were having them in mind when
you said that the Amiga could multitask, but not very well (which they can, btw.
Very well :))

Well, I can't argue here. Not because I agree, but because I don't know. I've never
used an A1000, or an original ST. When was the 1040ST released?

Hello.
Does anyone have any information of Wensuite3. Which was
reported in the last issue of Atari Computing. It did mention it's
web site, but when I tried to look for it, I just got rejected.

Have you checked your login script as you can contact but it might not
be recognised by your server. You could also have CHINWAG with Roy
Golding at rgolding@zetnet.co.uk or another ROY GORING
roy@incontrolinternet.co.uk

Yes, this is what I've found here too. Olivier's doesn't crash but
sites are limited due to the cookie implementation.

Whoops!!!
I just had a close look at my Atari and by scraping at the sticker a bit and wiping it down
I found out that the sticker on my Atari says it is a 520STE the reason I didn't notice this was
because the sticker had some dirt on it right over the E and muggins here didn't bother
to scrape the dirt off and have a look but presumed that the letter that could be vaguely seen
under the dirt was just a (tm) or an (R).

[Covers face and feels immense embarrasment]

So what is the 52STE's specification (Presumably similar to 520ST and STFM's)?

First of all, where on earth are you?

A good source for that sort is stuff is online auction sites like ebay or
whatever is closer to wherever you live.

Atari actually did the same and launched a console based on the Atari 8bit,
this was launched at the same time as the 130XL and 520ST. Flop again.

> Those idiots just never learnt from their mistakes! (CDTV anyone?)

> first place! Anyway, what set the STE apart from the ST?

The STE was an Enhanced ST. The CPU was the same, and externally there
wasn't much to differentiate from the STF. However, inside it had a separate
blitter chip, An DMA chip for stereo sampling, stereo RCA outs, a new video
chip with hardware scrolling and a 4096 colour palette (but still only 16
colours on screen), extra analog joystick ports and standard SIMM memory (up
to 4Mb). The problem was that there was already a huge installed base of STF
machines, and there were not enough enhancements for the developers to make
STE-only versions of their programs. A few STE-only games came out, but not
a lot.

Here in France the proportion was 50/50 between Amiga and Atari before the
PCs took over. In Germany I understand the Atari was more successful.

And the multitasking on Amiga in early days didn't just meen to run more programs at the same time. This multitasking was and is still a part of the Amiga 'look and feel'. It was not only formating a disk in the background. And with 1MB you really had to knew what you did when e.g. running K-Seka and D-Paint at the same time.

It's hard to explain to someone who never really used an Amiga. But I remember back in my study time I typed some text for LaTeX on Amiga with some friends. They normally used Win3.11-crap. We heard some mods in the background from an AminetCD. To hear a new mod I did the following: 1) click on the gadget 2) go back to the editor. My friends did it the following way: 1) click on the gadget 2) wait till -decrunching- window disappears and music plays 3) go back to the editor.

So for my friends there was not much difference in using real multitasking and Win3.11 what-ever-it-was-called. But for me it was and is still a pain not to have that smoothness on other OS.

Sven

actually the Amiga did pretty well here in the DV and CGI business - something that has since been taken over by Macs - thanks mostly to the Toaster.. as for entertainment i STILL think it played second-hat here in the US to PCs and consoles - even though it was so much better.. you have to remember that in America at that time most people that owned computers (that werent C64s) were also employess of IBM.. and IBM was also that greatest contributer of computers to education - so right from school kids were brought up using PCs.. as an Amiga user i always stood alone defending my platform - 9 /10 friends all had PCs.. they loved those grainy looking and sounding 16 color Sierra games.. they thought their PCs cranked when they played Commander Keen or Duke Nuke 'em (the original) - that was arcade entertanment to them.. of course i cant really say who had the last laugh..

Hello Paul,
I'm sure I had some thing similiat happen once and I think in my case 1 of
the notes in MGNOTICE had been corrupted and this caused the problem. You
could try renaming the notes in GEMSYS\GEMDESK\NOTICE from *.NOT to *.NOX.
If magic then loads ok try renaming each note back to .NOT until you find
1 it fails on.

Yours
David James

I think Shivji designed a pen computer, GO. Btw, the word "Atari" is a
term used in the ancient game of Go... ;-)

I do not agree with you, Terry. I don't know if it's worth loathing,
but indeed the PC has (almost) killed the diversity in personal-computer
development. In those early days Amiga, Atari, Mac, PC, PDP, offered various
hardware and software approaches, and differed in more than just an OS.
A PC with any OS is still the same board with the same CPU, the same
principles and logic of functioning, etc. For example, has computer history
taken a differnt turn, or in some alternate universe, we might have had
VME bus as the universal wide-spread expansion provision. Or, maybe,
a domination of cheap SCSI mass-storage devices instead of IDE ones,
or VMS as a standard operating system...

:> It's true, that Falcon has better hw-specs than _unexpanded_
:> A1200, but Atari's have always suffered from bad OS.

: How so? TOS has always been rock-solid and built-in on ROM.

Yes, but then again, TOS just grew more and more antiquated as the years passed, whereas AmigaOS has been constantly maturing.
As you stated in another thread, the differences between version 2 and version 4 are merely cosmetic, and trust me, version 2 is by no means a nice little OS, albeit stable.
Besides, the AmigaOS has also been built into the ROM. Only the desktop (Workbench) and luxury programs are loaded from disk, but insert any random non-bootable disk into my A4000 or A1200, and you are presented with a GUI screen with a shell, all essential libraries and the most essential commands.
It wasn't by pure chance that MultiTOS was bundled on disk alingside the firmware TOS 4 with the Falcons.

:> AmigaOS runs circles around the Atari's OS(es) and makes
:> Amiga therefore better for serious use.

: And MiNT matches or beats AmigaOS on most things (although, when
: Atari was involved, it wasn't half as developped as it is now).

MiNT seems jolly, I have it on a coverdisk around here, but I'm uncertain as to whether it will run smoothly on my 1040STFM.
However, it is a tad UNIX-like, somewhat cryptic, isn't it?

:> And don't forget A3000 which had 030/25MHz, support for VGA
:> and RGB, SCSI etc before Falcons ;)

: ...and came out after the TT, as I recall.

Those two could have been twins. Never have I seen two computers from disparate brands being so similar.
The same goes for the Falcon and the A1200, although the Falcon was more luxurious, but also more expensive, whereas the A1200 has proven more future-compatible.

No, I admit to having no such experience, but whereas the SID had four
kinds of waveforms (triangle, sawtooth, variable pulse (square) and
noise), the ST Yamaha chip had to the best of my knowledge only the square
wave.
Simply by listening to the old ST chip, which was also present in the
Spectrum and the Amstrad CPC, the lack of waveform variation is clearly
audible.

BTW, does the Yamaha chip have envolopes?
And wasn't the chip also present in the SEGA Master System (which was
downgraded soundwise from the Mark III, which had PCM sound)?

Hmm, the Mega Drive had a Z80 as a sound chip, didn't it? Interesting
choice. The SEGA arcade boards had the same configuration, IIRC, with a
68000 as main CPU and a Z80 as sound slave. Would the Z80 have an
additional slave for the actual manifestation of sounds? It would seem to
me that having an entire 8-bit processor dedicated to sound would yield
very impressive sounds, although it perhaps wasn't perfectly suited to
mixing and such tasks.

I've seen webpages on both systems that do not load at all
and it's a current setup on both systems, so I don't see amiga
as that much ahead. Also there are alot of small things
the latest Mint+n.aes+thing that will make an amiga user
take note. I've invited amiga users over, and they are
always suprised by some of the features. The realtime windows
generally makes jaws hit the floor.

No it isn't. It runs AmigaOS and programs via emulation. Anything
which uses emulation is not an Amiga (or any other platform that may be
emulated for that matter, such as the 68K Macs).
This means that whatever Amiga Inc. finally give us, it will not be a
real Amiga unless they find a new CPU chip that directly executes 68K
binary files. They'll give us an "Amiga-like" computer, but they won't
give us a real Amiga.

>a console.

Well, the CD32 could have been a relative success if they managed to keep
up with demand. With a more fancy / robust design and some fast RAM (1 MB
or something) it could probably be twice as good looking and running games
at twice the speed. Ah, imagine a 020/28 and a lower price point as well,
but I guess that would be impossible back in those days. ;)

Anyway - they couldn't keep up with demand, if they could it might have
saved Commodore for a while. If the CD32 was a success, it could have given
developers a larger market to develop for and could have helped the
entertainment software situation for the normal Amigas as well.

It is a taxing mode, but there were actually a few games that
ran with it...

->> > pictures. the falcon has the 65536 color mode which is very
->> > nice but also has a heavy dma load.

Again, "hi color" mode (TC) on the Falcon is the preferred mode,
faster than 256 color mode...

I just ordered Mario Becrofts ST TOS 2.06/IDE board for my
Mega ST so I'm going to sell my external HD setup. Its a
Seagate 4.3 gig SCSI hard drive, number 34555N I believe,
and its only 1-2 years old. Very solid, good shape, includes
a dual bay case from Dirt Cheap drives, PS and all that. Let
me know if you need a HD adaptor, I might have one lying
around that I would throw in as well...

Best offer. Buyer pays shipping and handling. Anywhere in
the continental US.

I also have Ratsofts BBS software for sale. Full commercial
version. I believe that its the last one released at v2.01.

I paid $89, will let go for $25 or best offer. Buyer pays
S&H, anywhere in the continental US...

Reply via E-mail. Thanks! ;-)

ST ram is limited to 14 MB. TT ram by the CPU's addressing
range, which is 256 MB on a 68030.

Have you tried N.AES 2.0 on MiNT 1.15.5 with Thing desktop and a
full MiNTOS distribution running behind it? Seems you don't know
anything about the current state of Atari.

As, for software support, that mainly happened because when the
company Atari withdrew from the computer market, developpers
decided upon committing corporate harakiri, instead of looking
at how large the user base there was. When developpers stopped
delivering the goods and the concept of freeware hadn't yet hit
this planet, user were left with a good platform without new
software and many went to windows because of that.

Was this a late version with the patch? Certainly it might have worked
with the NVDI screen acceleration (in some NVDI versions) but was
renowned for not printing with NVDI's GDOS (it was printing we were
discussing). I only started to used NVDI from v4 onwards and the two
didn't get on.

> >Or SpeedoGDOS for that matter
>
> Mine was very happy with SpeedoGDOS

Mine wasn't! Made the thing highly unstable, and couldn't handle rotated
text in imported metafiles etc (again IIRC - it's a long time ago).
Admittedly text in metafiles seems to be a problem generally (it's the
same with Windoze programs too).

> >(it's not that keen on FontGDOS either -
>
> Mine was exeptionally happy with FontGDOS

IIRC (long time ago now) I had problems with page sizing, for one. ISTR
there were some problems with the fonts, too (possibly the rotated text
in metafile problem again). It was better than with Speedo, though;
hence the "not keen" rather than "doesn't get on"!

> >There was once a patch available for making v.2.0 work with Speedo or

I'll bow to your superior knowledge on this one. My own solution (after
much experimentation and destroying half a forest in test prints over

the years) ended up being to have a separate setup just for Timeworks (with GDOS 1.1), and eventually I switched most of my DTP to Papyrus and Calamus. Shame, really, I liked Timeworks a lot.

> It thought it "only" allowed 1,2,4,5,6,8 (6 being a "trick-in-some-way"
> 5-bitplane mode)... Anyway IIRC it also had two layouts of
> plane-interlacement...

no, aga allows any (1,2,3,4,5,6,7,8) bitplanes without restrictions.
on ecs (a500...) you could only use 1-6 bitplanes, whereas 6 bitplanes
only used a 32 colors palette and the 6th bitplane was used as
"darken" mask. whenever a bit was set in the 6th plane, the
pixel was displayed in half brightnes. this mode is called
"extra halfbright" and is one of the "accidents" of the amiga
development. the hardware developers wanted to remove it again but
they forgot it :)

another mode is the HAM mode which works on 6 or 8 bitplanes.
it works like this: you have 2 bitplanes which determine which
of the 3 rgb colors is changed. the value changed is determined
from the other planes, either 4 or 6 bits, depending on 6 or 8
planes activated. also there are 16 or 64 "base" colors which
can adressed directly.

this mode is ofcourse very complicated to handle and therefor
can only be used for displaying pictures.

> > planes, while the falcon only allows 1, 2, 4 and 8. the falcon
> > still has no scroll registers and has a hard deal moving all

> What do you mean by scroll registers? Since the STe hardware scrolling is
> possible!

i mean horizontal shift by hardware. the 1200/4000 can scroll any resolution
with just one register access. and the hardware isn't even bound to full
pixels, you can also scroll by 0.25 pixel steps for VERY smooth scrolling.

the amiga has 2 scroll registers, one for the even and the other
for the odd bitplanes. this way it's very easy to do parallaxing.
there's even a special mode to use for parallaxing, the dual playfield
mode. this mode is very similar to standard bitplanes, but the
two parallax layer both get an independent palette, so for
8 planes you don't have a 256 color palette, but two 16 color
palettes.

vertical scrolling is ofcourse possible by changing the bitplane
pointers, but this should be possible on atari too?

> > pictures. the falcon has the 65536 color mode which is very
> > nice but also has a heavy dma load.

> Better than doing C2P conversion IMHO! :)

well, c2p was a big problem back then when aga was young. nobody knew
how to do it fast. nowadays the c2p-converters are that fast that it
doesn't matter if it's chunky or bitplanes since the 16 bit chipram is
that slow, that the c2p conversion runs completely in chipram waitstates.

in clear words that means a complete 8 bitplanes c2p conversion is as
fast as simple 8 bitplanes copy. (move.l move.l move.l ...)

> > very small, all opcodes execute as fast on 020 as they do

> Some are faster (muls IIRC). And you have got a nice PMMU within! :)

nope, all cycle list i checked stated muls with same speed on 020 and 030.
besides, i never noticed a speed difference between these both processors
myself.

it's faster on 040 and ofcourse on 060 (2 cycles :)

Graham.

: development. In those early days Amiga, Atari, Mac, PC, PDP,
offered various
: hardware and software approaches, and differed in more than
just an OS.

Hi Djordje!

Looking at the hardware of the Atari, one can see much parroting from the old Sun systems, although Atari was cheapness personified... Also Atari ST and Amiga are technical "sisters". The same people conceived both systems. Jack Tramiel was the president of Commodore when the Amiga was constructed, and he brought people and (surely) drawings along when he left and got on with Atari.

Looking back one cannot help but wonder why the ST range didn't have better color graphics and sound from the very beginning? The MIDI interface and the brilliant monochrome monitor vere genial moves, but it surprises me they did save on excluding a real harddisk interface?

Looking at the OS:es, it appears that Amiga is the Unix-like and Atari is CP/M derived. The GEM (Graphic Environment Manager) from Digital Research is probably the best GUI ever.

: A PC with any OS is still the same board with the same CPU,
the same
: principles and logic of functioning, etc. For example, has
computer history
: taken a differnt turn, or in some alternate universe, we might
have had
: VME bus as the universal wide-spread expansion provision. Or,
maybe,
: a domination of cheap SCSI mass-storage devices instead of IDE
ones,
: or VMS as a standard operating system...

The VME-bus isn't specially particular, and contrary to some myths, there is no significant difference between the SCSI and

IDE solutions! The SCSI can queve commands, and that's it. Only reason for wanting to explicitly use SCSI over IDE would be for the ability to attach more units.

So is it fair to compare the following?
1024ST with the A1000,
ST with the A500,
Mega ST with the A2000/A500+,
STE with the A600,
Falcon with the A1200,
TT with the A3000,
But what can you compare a A4000 with? And could someone explain MiNT
to me and what a Milan, Hades(?) is? Is this a new OS for the Atari?
Like OS 3.5 for the Amiga?

Not quite the answer being sort I feel.

I am not particularly knowledgable about these things but IIRC ST-RAM is limited to 14MB because it uses 24bit addressing. This should actually allow for 16MB (like 24bit graphics = 16million colours) but the top 2MB are used to address the ROM and hardware.

Rich.

> even on our modern day PC's?

```
It's absolutely true. Windows has absolutely no real-time functionality, so
programmers cannot use the system to launch real-time events like MIDI. They
have to work around this by programming their own routines, which is messy
and leads to instability.

Microsoft advertises WindowsNT as being a real-time OS, but when you look at
the small print, "real-time" for them means +/- 0.25 seconds!!!

> If so, then why do "proffessional" studios use PC's?
> Are Macs just as bad? Whats the truth here?

Most studios use Macs, which are not as bad as PCs, but still a compromise.

Actually, I find the conversation quite refreshing up to now. For some
strange reason it hasn't yet turned into an Amiga vs Atari flame war yet,
but an intelligent comparison of two very similar platforms and the reasons
of their failures.

> Falcon with the A1200,
> TT with the A3000,

More like (considering release date more than model numbers)

520ST - A1000
STF/STE - A500
Mega ST - A2000
Falcon - A600/1200
TT - A3000

> But what can you compare a A4000 with?

No idea, TT maybe? when was it released, what are the specs ?

> And could someone explain MiNT

It's a TOS compatible multitasking replacement OS, that runs on all TOS
machines, and can be tweaked to be very Unix like.

> to me and what a Milan, Hades(?) is? Is this a new OS for the Atari?
> Like OS 3.5 for the Amiga?

Hades and Milan are 030 and 040 TOS clones, which are currently commercially
available. The 040 Milan is just being launched. These are based on ATX size
motherboards with PCI ports.

It has been in the alpha state for TOO LONG which is why I mostly use MyMail for emails now. I still use Newsie .94 for newsgroups though.

: :: And MiNT matches or beats AmigaOS on most things (although, when
: :: Atari was involved, it wasn't half as developped as it is now).
: :
: :MiNT seems jolly, I have it on a coverdisk around here, but I'm uncertain
: :as to whether it will run smoothly on my 1040STFM.
: :However, it is a tad UNIX-like, somewhat cryptic, isn't it?

: OK. try this test. run amiga OS without a GUI. hmmm. a little unix like
: isn't it? somewhat cryptic eh?

It is absolutely impossible to run the AmigaOS without a WIMP. The only possibility I can come up with would be to run a serial terminal (I've done that, great for playing MP3s while in the kitchen), but even then, the Amiga host would run an intuition GUI on the graphics console.
And no, I don't think that AmigaOS is particularly cryptic. I find it very well structured in comparison to every other OS I've tried. MSDOS and Windows are pure chaos, UNIX systems seem to like throwing everything into /etc and som /bins, and MagiC has much of the MSDOS chaos. Plain TOS is very clear, but also very basic.

: If I *want* to run a fast LiNUX like environment, I can. If I *want*
: an AES(Application Environment System) like gem.sys(multitos) or
: Geneva, or nAES, or XaAES, or.. I can. Want a desktop? choose a flavour!
: don't like gemini? run neodesk. don't like neodesk? run thing. don't
: like thing... I can.
: btw, what are your choices on the Amiga??

I'm rather content with my plain 3.0 Workbench, although I'd like to be able to manipulate it through the shell, something which is possible in the 3.5 Workbench, through the new ARexx port.
If you're not content with the standar dWB, you can run ScalOS, Directory Opus Magellan or ProBench.
I think that UNIX has got some interesting features, some of which I borrow into my Workbench setup (notably, certain command-line utilities and the TCP/IP networking), but I find the AmigaOS model better suited to desktop use than a direct UNIX-cloned system.

:> As you stated in another thread, the differences between
:> version 2 and version 4 are merely cosmetic, and trust me,
:> version 2 is by no means a nice little OS, albeit stable.

: I had a chance to use TOS 2 and TOS 4 again, over the last couple
: of days. While TOS 2 looks like the well-matured cumulation of
: several years of betterments, TOS 4 only looks like a colour
: version of TOS 2. Even worse (as Nicholas Bales pointed out),
: the Falcon is pretty much an STE in technicolor; nothing more.

To me, TOS 2 looks like an improvement over earlier versions, but
nevertheless a very limited package. It is quite unpenetrable, everything
being kept in a tidy little unit with no option for user configuration.

:> Besides, the AmigaOS has also been built into the ROM. Only
:> the desktop (Workbench) and luxury programs are loaded from
:> disk, but insert any random non-bootable disk into my A4000
:> or A1200, and you are presented with a GUI screen with a
:> shell, all essential libraries and the most essential
:> commands.

: Sounds like my TT. Has a barebone, but usable, desktop and some
: basic OS in rom, but is really more comfortable using Thing and
: a multi-tasking OS.

Exactly. Only the multitasking OS is in the Amiga ROM. What's lacking is
the desktop and the comfortability.

:> MiNT seems jolly, I have it on a coverdisk around here, but
:> I'm uncertain as to whether it will run smoothly on my
:> 1040STFM.

: I have been running MiNT 1.15.5 (and previous versions) on my
: Stacy here for quite a long time. I had it on STE before.

Those models may be upgraded, though. Plain old STs have no SIMM sockets.

:> However, it is a tad UNIX-like, somewhat cryptic, isn't it?

: That's the most wide-spread myth.

: If you ever have a look at the original MultiTOS installation
: disk, you'll see that even the MINT.CNF and GEM.CNF files can be
: as barebone as you want; no UNIX required.

I'll have a look at that coverdisk, then. All the archives on FTP sites look like hardcore UNIX distros.

: Btw, AmigaOS is also built around a _kernel_ which is as UNIX of
: a concept as it gets. Isn't that too cryptic and user-hostile? :)

I wouldn't call a round-robin multitasking kernel written in assembler a UNIX concept.
Besides, the kernel is quite uninteresting at a user level. One may complain about the structure as a programmer or hard-core user, but the application levels are what matters to the end user.

: Have you tried N.AES 2.0 on MiNT 1.15.5 with Thing desktop and a
: full MiNTOS distribution running behind it? Seems you don't know
: anything about the current state of Atari.

No, I haven't tried any NAES setup, only MagiC and TOS.
However, the software for NAES is the same as for TOS and Magic, alongside
UNIX ports, which are very helpful but also not something you'd buy an
Atari in order to run.

: As, for software support, that mainly happened because when the
: _company_ Atari withdrew from the computer market, developpers
: decided upon committing corporate harakiri, instead of looking
: at how large the user base there was. When developpers stopped
: delivering the goods and the concept of freeware hadn't yet hit
: this planet, user were left with a good platform without new
: software and many went to windows because of that.

When Atari withdrew, the concept of Freeware had existed for at least half
a decade. An old STE book from 1989 in my bookshelf advocates a lot of
PD/Shareware solutions, and PD was for example distributed by user groups,
magazines and PD libraries.
This doesn't change the current state of Atari software support, though.

No, compare the 130 ST.

: ST with the A500,

Make that the STFM.

: Mega ST with the A2000/A500+,

A2000 yes, A500+ no. A500+ is similar to the STE.

: STE with the A600,
: Falcon with the A1200,
: TT with the A3000,

Yep.

: But what can you compare a A4000 with? And could someone explain MiNT
: to me and what a Milan, Hades(?) is? Is this a new OS for the Atari?

MiNT means "MiNT is now TOS". It is a BSD kernel replacing TOS functions,
giving multitasking and UNIX-like features, for those who like that.
An A4000 should be compared to the MicroFalcon, but since that was
vapourware, there's no point in that.
Milan and Hades are Atari clones, and should be compared to BoXeR and
DraCo, respectively.

Whitch driver? AHDI 6.06?
IDE devices no need to format. Part. it and it is OK
AHDI doasnï¿½t knew the device. Use HDDriver.

Yes.
Needs external psu and case.
DOIT-Archives describes how to build external devices, so you can use
the same description also for cd-rom.

Best way, if you are not DIY ;), take a ready to use external scsi case
and plug cd-rom device into that case. Ready to use cases contains all
scsi plugs, id switch, psu and on/off switch.

STOP EQUATING "PC" with "WINDOWS"!!!! These words are NOT interchangeable.

there are many other operating systems to be found including BeOS, linux, freeBSD.... i can go on.

what we are trying to get to the bottom of is whether your Atari claims of poor midi timing on "the PC" are actually due to windows..... i realize this newsgroup is for Atari, not "PC" or "Windows" but it pisses me off..... if you're going to bash then atleast take the time to learn about what you are bashing.

warmest regards.

Hi All,
Hope this did'nt post twice.
9 out of 10 CAB cookie expire dates are 1 JAN 1970! The remaining dates are past 1 JAN 2000. General.cpx has correct date and I have'nt had a Y2K date problem (unless this is one). Dates on files in windows on my stock Falcon MKI (14 meg) desktop show correctly! Any thoughts?
John G.

Sounds fair enough.

> But what can you compare a A4000 with?

Not sure, I never heard of it.

> And could someone explain MiNT to me

It relaces parts of TOS (the GEMDOS) to allow multi-tasking,
device drivers, loadable filesystems, etc. and was developped
by Atari as the kernel behind their multi-tasking GUI.

> and what a Milan, Hades is?

Two Atari clones.

http://www.milan-computer.de/

(I cannot remember the URL for Medusa systems)

Good and solid it is but I found that with my setup CD-player slows down
the reaction of other programs. For instance deleting text by means of the
[delete] key doesn't happens fluently. Sometimes there is a brief delay

I also notice that something constantly is accessing my HD even if there
is no CD inserted. Hm, this reminds me to the problems I've with animated
gif's in Cab.

Right now I use a non-patched novaVDI 2.67. Let me see.
......
Even with a patched version of novaVDI my HD is accessed by ???
Strange.

I do like PlayMyCD but due the above describe problems I don't use it
anymore. Alexander Clauss's version works juust great here.

Same on this TT. I can do everything using point&click on N.AES
using GEM apps (which is still very user-friendly) or I can do
things the UNIX way using virtual consoles too (using the same
GNU tools as any other OS).

Basically, MiNT can be used with an AES and a desktop, in which
case it is only a multi-tasking version of the familiar Atari OS.
This kind of setup is easy to install and manage and remains very
simplae and user-friendly.

The great thing, though, is that one can also use UNIX things on
top, if desired.

Granted, most MiNT distributions make it look like MiNT is yet
another UNIX clone, but it doesn't have to be this way:

1) get the MiNT 1.15.5 kernel from any ftp site.
2) extract and install the appropriate version for your CPU type

MINTNP.PRG goes as the last item of your AUTO folder
MINT.CNF goes into the MINT folder of your boot partition
Hack MINT.CNF to your tastes, if necessary.

3) get the KEMD package from kellis.atari.org or any ftp site.
4) extract GEM.SYS and GEM.CNF from that. Discard the rest.

Hack GEM.CNF to your tastes, if necessary.

5) get Thing 1.27 from http://www.cix.co.uk/~inactive/

Select some nice background image and replacement icons, if
desired.

6) noticing the annoying "Shareware" words written all over the
desktop, stuff your registeration fee in an envelope or
transfer it to the author's bank account.

That's it. Here's a great MiNT setup. Beyond this, you may
purchase N.AES 2.0 to replace AES 4.1 (GEM.SYS) but otherwise
that's it. Now, where was the UNIX stuff in there?

>even on our modern day PC's?

I have no direct experience of this, but have heard about PC's having
inferior midi timing from enough independant sources to take it
seriously.
I can imagine why PC's have bad timing. The majority of them run
windows (which is a handicap) and then have to have drivers to get at
the midi ports on the sound card. If the music application is also not
well written then you have a really weak chain here.
Also i wonder what windows does to real-time editing

This also brings to mind a question you posed about atari emulators.
These would probably sit on top of the PC/Mac OS and create an even
longer chain.

Atari Midi Chain:

Sequencer -> TOS -> midi ports (nice and short)

>
>If so, then why do "proffessional" studios use PC's?
>
>Are Macs just as bad? Whats the truth here?
>
>Tim Conrardy
>.

* 4mb Falcon (main sequencer) *
* 4mb ste with internal hardrive (patch editing mainly) *
* Kawai K1 II *
* Kawai GMega *
* Yamaha DD12 drum pads (for recording drum tracks) *
* *
* Concerto sequencer *
* Various KI editors *

Yep, I've picked myself up a cheap Atari and i'm really impressed with
the midi timing compared with a PC running Windows.

The PC is just used for recording and mastering now as far as music
goes.

I love cubase v3.1 on the Atari - it never crashes and its very
responsive. Theres a few minor things I miss from the PC version of
Cubase, but theres also a few additional little things on the Atari
version that are great !

Mark.

In comp.sys.atari.st Martin-ï¿½ric Racine <q-funk@funkyware.atari.org> wrote:
: On 2000-3-22, John Selck <graham@cruise.de> wrote:

:> Amiga 1200 - Falcon 030

:> almost, if the 1200 didn't have support for 32 bit ram. okay,
:> in most cases you had to buy a small memory card but it was
:> worth it. I have heard of fastram cards for falcon, but at
:> the time i owned a falcon no programmer had taken notice.

: How many decades ago was that? All Falcon ram upgrades are
: TT-RAM based (except Atari's own).

It's sad that it seems so cumbersome and expensive to add, and how come it
is limited to an odd amount like 14 MB?

: [TOS, MultiTOS vs AmigaOS]

:> amigaos 3.0 has a lot of features even linux or windows still
:> dream of like true datatypes, localization support etc.

: Amiga OS 3.0 was available in 1993, when MultiTOS was released?

AmigaOS 3.0 was available in 1992. The A4000 was released autumn '92. The
A1200 was released around the turn of the year.

: Overall comments
: ----------------

: Most of the points about the sound and graphic hardware of the
: Amiga that you mentioned are well taken and were noticed before.
: Amiga still is a good game coding machine. However, Atari is
: better at serious applications such as MIDI and DTP.

I wouldn't say /is/. For MIDI, yes, but for DTP, Pagestream 4 is no less
suited for serious tasks than Calamus 98. Many glossies have been produced
with Pagestream.

: IMHO, as an Atari user, the Falcon was a real joke and is just
: not a good reference point at all. It did not deliver the goods
: it promised and the hardware combination is a complete joke, as
: it mostly was a horrible demo for clever Jaguar technology ideas.

The Falcon looks really novel, but was somewhat lacking in its
implementation. Nothing seems to have been worked out with that much
afterthought, and it is an expandability nightmare. Just look at the
people having problems adding something as rudimentary as an '040

accelerator.

: However, if you take a well-equipped TT, Hades or Milan running
: N.AES over MiNT, it measures up rather well against any Amiga.

Possibly. I'd still say that the Amiga is a generation ahead, and software
support is far better.

In comp.sys.atari.st John Selck <graham@cruise.de> wrote:

:> > amigaos 3.0 has a lot of features even linux or windows still
:> > dream of like true datatypes, localization support etc.
:>
:> Amiga OS 3.0 was available in 1993, when MultiTOS was released?

: no, but amigaos 2.0 was available which was a big step ahead
: since 1.x, far bigger than the step from 2.x to 3.x

AmigaOS 3.0 was very much available in '93.

:> Overall comments
:> ----------------
:>
:> Most of the points about the sound and graphic hardware of the
:> Amiga that you mentioned are well taken and were noticed before.
:> Amiga still is a good game coding machine. However, Atari is
:> better at serious applications such as MIDI and DTP.

: i agree with midi, but i disagree with dtp. the main reason why
: ataris were used as dtp machines was the not interlaced high
: resolutions. but since a1200/4000 the amigas have freely
: configureable sync registers which allow almost any video
: output (yes, you CAN destroy monitors with it :) so the point
: of the interlace-flickering is no more.

Of course, the non-flickery resolutions of AGA are very slow. The DTPer in
our user group was taken to the edge of desperation by those resolutions.
Really, if you're going to DTP, you're either forced to run a flicker-free
AGA resolution with few colours or a graphics card.
Personally, when I ran AGA resolution, I preferred a flickery Super72
SuperHires Interlace with overscan (896x600) for Workbench work, whereas
I ran wordprocessors and newsreaders in a flicker-free Multiscan or
Euro72.

:> However, if you take a well-equipped TT, Hades or Milan running
:> N.AES over MiNT, it measures up rather well against any Amiga.

: against what amiga? nobody uses a plain 1200/4000 anymore, the
: least thing you can expect is a 68060, people who seriously
: use their amigas have ppc inside.

That's not really true. I trundle along with a 25 MHz 68040, and a
Commodore design at that. I'm thinking of upgrading to 40 MHz, but I'm
uncertain as to the '060, or the PPC at that, although it sure looks

attractive as an MP3 player slave.

:> : However, if you take a well-equipped TT, Hades or Milan running
:> : N.AES over MiNT, it measures up rather well against any Amiga.
:>
:> Possibly. I'd still say that the Amiga is a generation ahead, and software
:> support is far better.

: I've seen webpages on both systems that do not load at all
: and it's a current setup on both systems, so I don't see amiga
: as that much ahead. Also there are alot of small things
: the latest Mint+n.aes+thing that will make an amiga user
: take note. I've invited amiga users over, and they are
: always suprised by some of the features. The realtime windows
: generally makes jaws hit the floor.

I'd say that the current Amiga browsers have a far better chance of
displaying pages than CAB, Wensuite (if that ever works) or Draconis.
Draconis won't even acknowledge GDOS fonts, which immediately disqualifies
it from serious use as far as I'm concerned, although it is supposed to
have Javascript, which is present in all three major Amiga browsers.
Overall, the Amiga browsers feel far more mature than the Atari ones. I'm
not at all impressed by CAB, mainly because it is very ill-suited to
online activites, only being able to access the HTTP protocol through an
"overlay", and thus lacking the progressive updating of other browsers. To
add insult to injury, it isn't even developed anymore.
And if you want candy, Voyager 3 has got a Flash plugin, as well as an
inline PDF plugin, though I'm not sure if that one's public yet.

As for opaquely moving windows, I did that years ago on my A1200, but I
don't find it novel enough to warrant the CPU waste.

Tunesmith Now FREEWARE

I am Happy to announce that Tunesmith for Atari is now FREEWARE! Thanks go to Trond Einar Garmo of the Norwegian University of Science and Technolgy for providing the latest version of Tunesmith that is without copy protection (from the time when Dr T software removed all copy protection)and also to Jim Johnson for coding it and giving permission to have it as Freeware. Thankyou Jim! (now I can stop bugging him!) Jim has his own web site with some very interesting MIDI software for PC. Check it out
at http//: www.technotoys.com

This all happened from discussions we were having on the new
Atari-Midi mailing list . I found out that Trond had the Unprotected
copy, so I mailed Jim Johnson, and he was more than happy to give
permmision to have that version as a download. I have been after Jim
for TWO Years to get it released.
So looks like we Got another one.!!

Go get it at:

http://atari.atlantis-bbs.com/timidi
On the Tunesmith page.

Tim's Atari Midi World

Enjoy

Have you tried Chris of ASP, he does a mouse burster which lets you
use PC mice, which are cheaper and easier to get.
I have one which works a lot better then the old Atari one did.

Sicko's I agree. Its one thing to advocate against an OS but to attack a proponent in this way is just not a game of cricket. I do wonder if 'MiNT haters' really were to blame here tho'. Some internet savvy hackers could simply have 'eavesdropped' on the newsgroup, and decided to try add fuel to the fire. I'd be curious to know if the traffic they created was logged and hence tracked back to the original source by kellis ISP sysadmin...

> This isn't just a sad day for the Atari community, it's a sad day for

This is just the first time a popular Atari users site has been scrunched to my knowledge. This stuff happens to many sites all over the planet, but never the big ones, due to the risk of being caught.

Kind regards,

I guess while I am here , here is some more info on Tunesmith:

Just a little background on Tunesmith. It came out at the time when algorithmic programs were the "big thing"..late 80's. Actually Dr T kicked it off with the "Algorithmic Composer" package for the Commadore 64. A Certain Jan Hammer found out about it and had to purchase a Commadore 64 system to put next to his $30,000 Fairlite just to run Algorithmic Composer! He used it on his Miami Vice scores. Then Jim Johnson, the Author, decided to upgrade his ideas and the result was Tunesmith for the Atari. Also Dr T (Emile Tobenfeld) put out "Fingers", another algo-comp program.Both could be used as modules for the MPE system on Dr T's KCS sequencer. Also "M" (Intellegent music) and Ludwig(Hybrid Arts)came out at the same time along with Music Mouse (Laurie Spiegel)
Quoting from the manual:"Tunesmith is a program for generating Musical themes and variations. Themes my be played using Hundreds of different scales, and an accompaniment generator allows the creation of an infinite number of accompiments based on these themes.Themes can be linked to form a complete song."
Basically (in musical terms) It takes a scale (such as a C-major scale) and creates a "theme" from the scale using parameters you specify. Variations of the main theme can be created as well.The theme then can be transformed into a 5 part Accompaniment, with controls for patch change, octave,articulation, velocity, with "algorithms" for harmony "types" and more. The settings can be saved as presets for later recall when you "play" the themes into a module called
the Arranger which makes it into a "song". Much like taking "patterns" in a sequencer and linking them together to form a song. What makes it interactive is that you can click on any of the parameters while it is in "record " mode and it saves it in the arrangement. Much like "M" which captures your "performance" as a "movie"and saves it as a midi file. In Tunesmiths case, you can save it as a Tunesmith file, or save it as a KCS sequence file, OR..it

operates within the MPE and records right into KCS!

I was always wondering if the BAD Midi timing thing on PC's was a Myth or
reality. I was told that Atari has the tightest midi timing, so that
is ONE reson I use Atari for Midi. (the other is all the cool Midi S/W
you can't find anywher else) So is this MYTH or REALITY: Midi timing ,
even on our modern day PC's?

If so, then why do "proffessional" studios use PC's?

Are Macs just as bad? Whats the truth here?

Actually, no, the overlay is the key to upgrading.

Right now, SSL support is possible on the Mint-Net overlay,
because it was done using freeware components (OpenSSL) and
developped outside of Alexander Clauss' reach. If we had to
wait for him, _none_ of the overlays would support SSL.

> version 2 is by no means a nice little OS, albeit stable.

I had a chance to use TOS 2 and TOS 4 again, over the last couple of days. While TOS 2 looks like the well-matured cumulation of several years of betterments, TOS 4 only looks like a colour version of TOS 2. Even worse (as Nicholas Bales pointed out), the Falcon is pretty much an STE in technicolor; nothing more.

> commands.

Sounds like my TT. Has a barebone, but usable, desktop and some basic OS in rom, but is really more comfortable using Thing and a multi-tasking OS.

> MiNT seems jolly, I have it on a coverdisk around here, but
> I'm uncertain as to whether it will run smoothly on my
> 1040STFM.

I have been running MiNT 1.15.5 (and previous versions) on my Stacy here for quite a long time. I had it on STE before.

> However, it is a tad UNIX-like, somewhat cryptic, isn't it?

That's the most wide-spread myth.

If you ever have a look at the original MultiTOS installation disk, you'll see that even the MINT.CNF and GEM.CNF files can be as barebone as you want; no UNIX required.

Btw, AmigaOS is also built around a _kernel_ which is as UNIX of a concept as it gets. Isn't that too cryptic and user-hostile? :)

(The '030 can address up to 4G [4096M]. If there is any limit, then it
is due to the use of a "cut-down" '030 CPU, or a hardware/board limit by
the computer manufacturer)

The address space of an Atari is divided up like this:

0-14M ST RAM (16-bit, accessible by hardware)
14-15M TOS from v1.6 onwards
15-16M Hardware (sound,disc,MIDI etc)
16-4064M TT RAM (32-bit)
4064-4080M VME hardware
4080-4096M mirror of first 16M

(TOS lived at the 192k of ROM beginning at address FC0000 [15.75M], but
moved to E00000 [14M] with the introduction of the STE [TOS 1.6] and the
TT [TOS 3.0] in 1990)

Without JT, we wouldn't have had an ST.

It was him that brought Shiraz and co from C= to the bankrupt Atari and
designed the ST.

you're saying the atari doesn't need drivers? perhaps they are built-in and
you don't realize it.... correct me if i'm wrong, but the OS has to have some
type of logic written in to interface with any device. if so, then the atari
does have device drivers.

Umm.... Llamatron ... Robotron.... Lamatron... Robotron... Duh...

It's SUPPOSED to be a lot like Robotron, but in a bizarre, almost
parody way. In many ways, it's BETTER than the implementations of
Robotron.

A true classic!

:> Besides, the kernel is quite uninteresting at a user level.
:> One may complain about the structure as a programmer or
:> hard-core user, but the application levels are what matters
:> to the end user.

: Same on this TT. I can do everything using point&click on N.AES
: using GEM apps (which is still very user-friendly) or I can do
: things the UNIX way using virtual consoles too (using the same
: GNU tools as any other OS).

How pretty. I love rudimentary UNIX thingys since they make multi-platform
computing so much more uniform.

: Basically, MiNT can be used with an AES and a desktop, in which
: case it is only a multi-tasking version of the familiar Atari OS.
: This kind of setup is easy to install and manage and remains very
: simplae and user-friendly.

: The great thing, though, is that one can also use UNIX things on
: top, if desired.

How come there are still people holding out against multitasking, then?

: Granted, most MiNT distributions make it look like MiNT is yet
: another UNIX clone, but it doesn't have to be this way:

: 1) get the MiNT 1.15.5 kernel from any ftp site.
: 2) extract and install the appropriate version for your CPU type

: MINTNP.PRG goes as the last item of your AUTO folder
: MINT.CNF goes into the MINT folder of your boot partition
: Hack MINT.CNF to your tastes, if necessary.

: 3) get the KEMD package from kellis.atari.org or any ftp site.
: 4) extract GEM.SYS and GEM.CNF from that. Discard the rest.

: Hack GEM.CNF to your tastes, if necessary.

Aha, so that's why the GEM would no longer react to executables. ^_^;;

: 5) get Thing 1.27 from http://www.cix.co.uk/~inactive/

I'm a Gemini person, myself.

: Select some nice background image and replacement icons, if
: desired.

: 6) noticing the annoying "Shareware" words written all over the
: desktop, stuff your registeration fee in an envelope or
: transfer it to the author's bank account.

What, no Visa?

: That's it. Here's a great MiNT setup. Beyond this, you may
: purchase N.AES 2.0 to replace AES 4.1 (GEM.SYS) but otherwise
: that's it. Now, where was the UNIX stuff in there?

I'll have to try this out, although I doubt that there'll be any memory
left in my ST then. Oh well, time to visit that nifty hardware hack page
again. =)

:>development. In those early days Amiga, Atari, Mac, PC, PDP, offered various
:>hardware and software approaches, and differed in more than just an OS.

: You still have Ataris and Macs. You have many, many different types of PCs.
: You have different types of laptops and handhelds. There are numerous OSes
: and many different motherboards, hardware add-ons, etc.. I just don't see
: this great loss of diversity.

I have an array of PCs out in the kitchen, and they function much the
same, all of them. They all have ISA slots. If I buy an Ethernet card, it
works on all of them. If I remove a drive and insert it into another box,
it will quite happily boot, unless I've configured it for something very
odd.
The only real odd beasts are my PS/2 boxes, which have MCA instead of ISA
and ESDI instead of IDE, but these are AFAIK no longer produced.
I dare say that the differences between these are far smaller than those
between the PCs, my Ataris, my Amigas, my DECstation or my Mac.
And no, ataris are not produced. The numbers of Milans and Hades produced
are absolutely microscopic next to the volumes of PC clones.

:>A PC with any OS is still the same board with the same CPU, the same
:>principles and logic of functioning, etc. For example, has computer history
:>taken a differnt turn, or in some alternate universe, we might have had
:>VME bus as the universal wide-spread expansion provision. Or, maybe,

: So it would be okay to have VME dominate, but it's not okay to have your
: choice of serial, parallel, SCSI, firewire and USB? I thought you wanted
: diversity?

I for one could go without VME (Zorro should dominate! =), but I wouldn't
mind if it received a larger slice of the market.

From: dzander@solaria.sol.net
Message-ID: <38dd9e0b$0$88804@news.sol.net>
Source record: 63764

First, I would like to thank everyone who read my request for help and took the time to respond. I have read all responses and to the best of my knowledge I tried all the suggestions. Some responses did not apply to me because I do not use the MagiC operating system and one person offered to email a special program to me but I know very few people in this newsgroup and his name was not familiar and I am not sure if I can trust him. (he contacted me privately and offered to email his special program).

What I want to do is I do not want to run any programs from my hard drive's auto folder. I accidentally rearranged the programs that I had in the HD's auto folder and now when I use my (external) hard drive what happens is everything starts out OK but then when the desk top appears it shows the A drive, the B drive, all hard drive icons from C through J (these are all correct; I have eight partitions) but then the mouse turns into a BUSY BEE and stays that way. I am able to move the mouse cursor around on the screen but it is a BUSY BEE and I cannot use it to open any disk icons or activate any pull-down menus.

All the connections are fine, the power is fine. I know what the problem is; I know that I rearranged the programs in the auto folder. Before I rearranged them they all worked perfectly well. The problem is that I *cannot* prevent the hard drive's auto folder programs from running.

I have rainbow TOS 1.04, 720 Meg external harddrive with 8 partitions C to J ICD Link 2, when the hard drive boots up it says ICD AUTO BOOT and proceeds to give information about read and write caches and other info.

NEW INFO! I booted my hd up many times and tried to read very quickly what it said. I caught something that said, "GDOS error, use GDOSFIX to fix" (or something to that effect) So now I know which program is giving me the problem. But how do I fix it? how do I get into the C:\AUTO folder to remove the program "gdos.prg". Obviously, it must be run in a certain order and because the programs run in alphabetical order then gdos.prg is getting confused.

Surely if you are seeing your desktop with partitions on it then you
are past the autofolder? Might it be one of the accessories? Did you
auto-install any program to start running on boot-up?

Just tried with the ICD driver here and it bypassed the HD just fine.

You have to press (and keep down) [Alternate] at the right time. If
pressed too early it will not be recognised at all. I wait appr. 0.25-
0.5 sek. and then press [Alternate] and keep it down.

You can freeze the boot by pressing Control-S. It'll allow you to read
any messages displayed by the programs running from your auto folder.
Pressing Control-Q will resume the boot from where it freezed. It will
NOT reboot the computer. You can repeat that Control-S/Control-Q operation
as many times as you want during the boot process.
As for your problem concerning skipping the hard disk's auto folder while
booting, are you sure you press Alternate THROUGHOUT the boot? You must
press Alternate as soon as you turn your computer on and NEVER release
it until the desktop shows up. If you release it, even for just one second,
the system will try to boot your hard drive. There is absolutely no reason
to my knowledge why this shouldn't work and why this shouldn't allow you
to launch ahdi.prg from a diskette, and so access you hard drive's auto
folder.

J-F.

> to give information about read and write caches and other info.

OK, so you're using ICD. Paraphrased from my ICD manual (came with
Link1), you have two choices:

1) Boot from floppy with HD turned off, then switch on HD. Once it's
initialised, run ICDBOOT.PRG from the floppy (a copy should be in the
auto folder of the supplied ICD software disk). You then need to make
icons for partitions on the desktop in order to get at them. (This has
been suggested before, I know, but there is no way the computer can use
stuff from the HD with this one as it's not there when the computer is
booted!)

2) Use a diskette with IDCBOOT.PRG in the auto folder. Turn on the HD,
let it initialise as usual, then turn on the computer and hold CTL-LEFT
SHIFT-ALT simultaneously. As you have TOS 1.4, you *must* wait till the
floppy access light comes on before pressing these three keys.

There is a difference. 1) will use nothing from the HD at all, whereas
2) will use the desktop.inf and accs from the HD but the auto folder
from the floppy. So if the problem is really an acc rather than an auto
program 2) won't work whereas 1) will.

One possible scenario as you are getting to the desktop before the crash is that an acc doesn't get on with whatever you altered in the auto folder. It's possible that this may still cause a crash if the same acc doesn't find what it wants when you boot using the floppy's auto folder - so you may find option 1) is the best bet.

Once you're in, get yourself a boot manager such as Superboot to save yourself the hassle in future!

HTH

:>works on all of them. If I remove a drive and insert it into another box,
:>it will quite happily boot, unless I've configured it for something very
:>odd.

: That's good, isn't it?

No, it isn't. ISA isn't good.

: My point is there are countless hardware, software and OS choices, so I
: really don't see a lack of diversity. The fact that a lot of it all is
: interchangeable is what people WANT, I think.

While OSes are interchangable, processors and buses are not. Besides, the
portion of the OS market occupied by Windows is absolutely dominating in
every sense. There is a small Mac share, and let's not talk about Be, OS/2
and the Unices. They hardly make a dent in the Billy empire.

: I don't think people decry the lack of diversity in VCRs because they all
: plug into any TV. Quite the contrary. If someone bought a VCR and then
: found it didn't work with their particular TV, they'd probably be a little
: angry.

Why settle for VHS when I could have Video2000?

: If one wants to insist that there is a lack of diversity, it certainly
: wouldn't be the fault of the PC; it would be because that's what the market
: wants.

Exactly. The market is at fault, not to mention the common people.

:>And no, ataris are not produced. The numbers of Milans and Hades produced
:>are absolutely microscopic next to the volumes of PC clones.

: Hey, I got slammed for saying something similar. I'm trying stay out of
: trouble here. ;^)

Well, but it is. 50 Milans are produced every month, and while this is at
the full capacity of Milan Gmbh, I can't think of a single PC item selling
in such low numbers.

Haven't heard of it (The CoCo equivalent here was the Dragon. Nice
keyboard, too). There is however a rather simple hack for connecting a
DECstation keyboard to the ST, either by the serial port or the MIDI
ports.

standard scsi cases are often not wide enough for a CD rom, and also are
expensive for what they are when you look at the price of something like a
tower case

Hi Ken!

What stack are you using? I use StiNG. I'm now using Dan's OVL 1.4003 too,
but it crashes the DHS site still. Olivier's 5.68 doesn't, but I need
Dan's for its better cookie handling.

Until Dan gets it sorted (though he thinks its StiNG's fault rather than
the OVL), I'll just have to change to Olivier's whenever I need to check
the DHS site.

Anyone know if I can change to OVL whilst Cab is loaded, or do I have to
quit out, change them over, and reload Cab?

Cheers!

James

5 1/4" cd-rom cases are all wide enough to fit a cd-rom in.
Around 100 DM here. (New, not used) If they too expensiv, take a used
one from flea markeds around. Take them for half the price. All single
parts, mainly the smal! internal psu, are more expensiv as any ready to
use case.

>gif's in Cab.

Yes I admit this happens, but for me, it is only when I am typing in
the contents of the CD. To get by this, I play the CD while I am typing
in it's contents. Then, things are fine. While playing the CD,
everything runs fine with no slow down. Sometimes I do get a BUS error.
I just hit the return button and the program quits, but the CD keeps
playing. If I set the program so that I have the mini-icon showing, the
bus error rarely come about. And I have used this with many a CD. I
will try and get a message to Alain about this.

>Right now I use a non-patched novaVDI 2.67. Let me see.

Yes, I use the same thing on my Hades...

>I do like PlayMyCD but due the above describe problems I don't use it
>anymore. Alexander Clauss's version works juust great here.

Alexander Clauss's program does the same thing for me only worst and
more often. it would slow down programs while a CDwas playing,
something PlayMyCD does not (at least for me).

Can anybody help me?
I want to know if my ST color monitor (US) has other uses.

don't you mean the Milan2 (68060) is being released, not a 68040.

actually. while you're at it, why not ask him about adding a feature that I've been finding quite useful on my Mac - access to the CDDB database to automatically download the titles and contents of the CD inserted to PlayMyCD's database when you're on the net? Saves a lot of time typing. Info on this is found at http://www.cddb.com : there are players that support this for mac, Windows, Linux and Acorn, so why not Atari?

No the problem is with my OVL. I need to sort it out, but have
put it down on the list as a working cookie seemed better than a non
working cookie. I''ll try to move it up the list and get it fixed. It
shouldn't be all that bad.

I was/am a loyal Atari user. I grew up on the Atari 800 and moved through all sorts
of models up to the 1040ST. I have since sold all my Atari stuff. I remember
when the ST debuted against the Amiga, I was mainly pissed at Electronic Arts.
They would not commit to the ST (at first) but committed to the Amiga.
I remember Marble Madness came out on the Amiga and every ST user was
pissed. EA finally started making a few games for the ST including Marble Madness
but the versions were definitely inferior. Also, don't forget that Amiga had stereo sound.
There were many titles for the ST that were good and never released on the Amiga.
Dungeon Master was released on the ST at first and still is probably the best version.
When the ST started to die off I actually broke down and bought an Amiga 500 (which
was taboo back then to own both systems). I loved the Amiga from day 1 and on. Shadow
of the Beast and Marble Madness and Turrican are the games that changed my mind. 100%
better on the Amiga than the ST. (don't forget that the regular ST's couldn't display as many
colors as the Amiga could on screen at once)

Today it's not as black and white as far as the system wars go. If you look at the consoles,
a few years ago you either had a Genesis or a SNES. Nowadays you own a Playstation, N64,
Dreamcast, and have the PS2 on reserve at Electronics Boutique and waiting to find more
info about Microsoft's X-box. I liked it when it was Atari 8/16 bit versus Commodore 8/16 bit.
The good old days are gone for sure.

You are correct and Nick is wrong.

Eagle: 030
Medusa: 040
Hades: 040 or 060
Milan: 040 or 060

They all have ISA and PCI slots.

Following an unsuccessful "Bottom of Wardrobe Sale", I am GIVING AWAY the following:

ST S/W
======
View II, Blitz Turbo, Easy Text Plus v1.4, Mini Office-Comms module, Degas Elite, Family curriculum module, Terminator 2, Falcon Classic Collection (flight sim), Powermonger Platinum edition, Triad Vol 1 & 2, Hewson Premier Collection, R-Type, Slapfight, Outrun, Speedboat Assassins, Mega Lo Mania (Works on Falcon in ST-Low)

Various joysticks, Atari Mouse.

Magazines
=========
Atari World Iss 2 - 11
Atari ST Review Iss 30,31,33,34 & 35
ST Format Iss 68 - 79 and 82 - 86
ST Application Iss 62 - 73

All the above will be given away FREE and therefore the "purchaser" will be liable for postage/transport. I live in West Yorkshire, England.

If after 2 months I haven't received any offers they will be trashed!!

Thanks for reading this!

4149. FS: (UK) MicroVitec 1438 Autoscan monitor

This monitor is in excellent condition, boxed with manual and power lead.
Displays all Falcon resolutions VGA/RGB. Needs a switchbox to work with
the ST. I am open to offers starting at 100 UKP (not including courier).

Also works with Amiga and PC, I believe!!

Please e-mail to the above address if you are at all interested!?

Quick sale appreciated.

Thanks for reading this advert!

Neil :-)

4150. FS: (UK) Falcon odds & sods

ANY offer will be accepted on the following:

Atari original 4Mb RAM Board

Nemesis Buffer board with free hot glue(!)

Epson SMD-300 High density FD - ex Falcon

Atari Falcon keyboard with TT-Touch clicks, in FreeKeys unit with home-brew aborted Mega ST type cable conversion. Needs soldering on Keyboard PCB - to solve loose connection malady!! Otherwise keyboard is in good condition and hasn't been used much, ie not worn out!!?!

PLEASE make me an offer I can't refuse on any of the above! Postage extra, I live in West Yorkshire.

Thank you for reading this!

Neil :-)

2 more cents:
Unfortunately the better system (tecnologically) does'nt always get top billing! Ex.: Satellite dishes vs. cable; gasoline vs. solar, etc. So why hate Gates? It's the way of the world!!!

For Terry May,
Maybe I'm misunderstanding something here, but VCR production is based on 'standards' not 'diversity'. Hence they all plug into a TV (VIDEO/RF or both)! This is notwithstanding PAL/NTSC/etc. And if I'm not mistaken, only a couple of companies actually design them (like Mitsubishi) for others like Pioneer! There's relatively "0" competition in that specific realm.
John G.

Please ...

There were early 520STs with single sided disks - but all normal ST
and STes have DD disks. TTs (MSTes too?) and Falcons have HD.

It was also a very easy modification to put an HD drive in any STe
since the floppychip usually could handle the increased freq (16MHz)
instead of the standard 8Mhz. Then it was just to pop in an HD drive.

Hi James,
I had similar problems when I started using Dan's OVL 14003 - 2
bombs and back to the desktop.
I had been accepting the cookie and, once I refused it, found I
had no problems. Strangely I AM accepting the cookie now yet the
problem seems to have gone away.....

```
Pressing either ALT or CTRL during the boot should either bypass the auto
folder, or boot to a floppy. Instead of keeping the key pressed down, try
hitting it all the time during the boot process. If at first you don't
succeed, try and try and try again.

If this still doesn't work, try switching on the ST with the HD off. Wait
until the ST boots up on a floppy, then switch on the drive. Then run AHDI
or whatever HD driver you are using from a floppy. Then create the C icon on
the desktop. That should do the job.

When did you see a 130ST in the shops? In was never released. There was a 260ST, but only available in very limited quantity. The first widely available ST was the 520 released at approx. the same time as the A1000, at least here in Europe.

> does have device drivers.

```
Yes, the serial/MIDI port drivers are built-in to the OS. The difference
with a PC is that these drivers are part of the OS, not something added on
to it. My point being that a multitasking environment like Windows is not up
to the task of real-time MIDI.

Ok, well, in my experience 99% of PCs are actually running windows. When one is talking about a Linux-box or a BeOS machine, he might as well specify it in the message. If not, we can safely assume that he's running windows, can't we?

Of course, I'm pretty sure the PC's fast hardware is quite capable of doing the job. The problem is OS running on it. When we are talking real-time OS, we're not talking about hardware.

> what we are trying to get to the bottom of is whether your Atari claims of poor

> bashing.

My claims are that the PCs poor MIDI timing are due a lack of real-time functionalities. I don't know how good Linux and BSD are at MIDI applications. I suspect BeOS should be pretty good, as it was designed with multimedia OS, but are there any apps? I'll probably be testing it next week when it goes free.

Of course, the killer OS for MIDI would be QNX or something similar.

Be prepared to pay at least $150 USD or more for such a card used.
I managed to get hold of a CrazyDotsII recently and it took $175
to get the seller to seperate the card from the system. ;-)

I have a Nova I no longer need, but it was spoken for before I had a
chance to even post it.

Good luck indeed...

> 1.76 MB with HD disks.

Early 520 ST used 360k single-side, then later 720k double-side.

All 1040 ST/STFM/STE always used 720k.

Early TT030 and MEGA/STE used 720k, then 1.44m later.

Falcon and clones always used 1.44m.

All of the pre-Falcon machines can be upgraded to 1.44m easily.
Atari floppy format was always MS-DOS compatible, but lacked one
specific bit on the bootsector until TOS 1.04 when it was fixed.

No, it uses a standard DD drive, _unlike_ the Amiga! ;-)

But so did the 1040STF and the later 520STF.

I have searched and sent to Alain LARRODE, GNU sources of CDplayers using CDDB.
So he has the possibility to do this,
BUT he IS NOT and CAN NOT be connected to the internet for testing and development.

Maybye you should register to PlayMyCD and try to convince Alain ;-).

Hi,
Do you refer to AHDI 6.06? In that case, just don't try any more. AHDI can't handle IDE's larger than 1GB if I remember correctly. Get Uwe Seimet's HDDriver instead and it'll do the magic...

>
<snip: a great deal of trouble>

When I had similar trouble, I did this (if I remember correctly; it's a
while ago):
1) switch on and immediately hold down every d*** key I could find, that is
ALT, BOTH SHIFTS, and even CONTROL.]
2) and I mean HOLD DOWN, not press and release and then hold.
3) Eventually appeared the Low Res desktop with A and B icons only.
4) Having AHDI.Prg on Floppy A (doesn't matter where),
click on it and wait to see what happens.
5) Click from menu INSTALL DEVICES and see what happens.
Your drives should then appear as icons.
If no C icon, install one and SAVE DESKTOP.
6) I think you can now rearrange your AUTO folder progs. If not,
rename AUTO to AUTO.X until you can do it later.
7) Click on A:\HINSTALL.PRG and choose drive C.
8) If I remember correctly, there's a message that the computer
will reboot.
Let it.
9) If all's well, it will boot from C: but ignore AUTO.X, so you can
rearrange it into a new AUTO folder and then reboot again.

BTW, you don't need to use HDX.PRG (which is for partitioning
or formatting).

Just let some other ST user confirm/deny/correct my memory (I have long
left the ST for a TT) before doing anything destructive.

Chin up!
Charles.

That's true. The PowerMac is a new platform unrelated to the original
Macintosh except that it is built "in the spirit" of the original Mac.
It doesn't run Mac software except via an emulator. Anything which uses
an emulator is not truly the platform being emulated.

The 520 STe has four 30-pin SIMM sockets. From factory it had
two 256k SIMMS (total 512k). They are easy to upgrade! It sounds
like yours has been already.
Here are the upgrade choices:
2 x 256k (512k total)
4 x 256k (1024k total)
4 x 1meg (4meg total)
* 2x 256k + 2 x 1meg (2.5 meg total) This is possible, but
requires a software patch to fix a TOS bug.

1 meg SIMMS are available here in the USA for only $1 each used.
Get the most out of your STe! Get all 4megs for only four bucks!

AFAIK both used standard DD drives, but different controllers and
formats allowed the Amiga to store 880k as standard.

MacOS 8.0 supports 68k. I use it with emulator on my Amiga...
I think 68k was dropped at OS 8.5.

Mainly because commerical VME cards are considered industrial
equipment and sell with a correspondingly high price tag.

Also, several manufacturers flatly refuse to provide programming
docs or open source drivers. They support mainly OS9 and that is
the only thing used on the VME market, in their opinion.

Who said it was "deprecated"? I thought it was used by multitasking apps
since MultiTOS? Anyway according to default DESKTOP.INF settings, APP seems
to be totally equivalent to PRG, isn't it?

4189. Midi Timing: Atari vs PC

Newsgroup: comp.sys.atari.st
Date: 2000-03-27 00:00:00 UTC
From: Tim Conrardy <timconrardy@my-deja.com>
Message-ID: <8bnqug$11u$1@nnrp1.deja.com>
Source record: 63702

Hello All:

As of late there have been discussions regarding Midi Timing: Myth or reality on a PC vs Atari. I asked the Question to Jim Johnson, who is in a very good position to answer the question intelligently since he has coded for Atari (DR T software) and now for PC (Technotoys)His reply is the BEST I have heard, so he gave me permmission to post it here. Hope this clears some things up and presents some interesting reading as well.

Tim

QUESTION: How is Midi Timing on a PC?

JIM JOHNSON REPLIES:

Boy, this is a tough question.

First of all, there is some a nugget of truth in the myth that Windows
cannot do accurate MIDI timing. The nugget is this: Yes, a single-tasking
OS, because it is only doing one thing at a time, will have fewer timing
problems than a multi-tasking OS. A Commodore 64 (1 mHz, 8 bit) has great
MIDI timing. And it is possible for Windows to have cruddy timing, but it
doesn't have to.

Here are the things that can make Windows programs have bad timing:

1) 32-bit code. Win 9x and Win NT do not allow 32 bit code to be executed
from interrupts, which is necessary for obtaining tight MIDI timing. I
can't understand why they overlooked this, but from reading their excuses
for it
(http://msdn.microsoft.com/library/techart/msdn_mlatency.htm) it sounds like they simply didn't think about it until it was too late! The
solution is to put all MIDI code in 16-bit DLLs, which is technically
challenging, and a step that the vast majority of part-time MIDI

programmers simply overlook. So a lot of shareware and freeware MIDI
programs will have atrocious timing for this reason - and I think this is
the primary contributor to the impression that Windows has bad timing.

2) Disk access. Windows hits the hard disk a lot - for all the usual
reasons, but also because of its screwy memory management default settings
(search the web for a program called Cacheman - it's amazing what it
reveals about Windows). With IDE hard drives, especially if DMA is not
enabled, this can cause glitches in the timing. The solution to this
problem is to use a SCSI hard drive, or to make sure DMA is enabled for any
IDE drives.

3) Modem activity. For some reason, when my modem is firing up (dialing), I
get timing glitches. Presumably this is because the modem is blocking the
interrupts.

In my experience, when the previous conditions are satsified, Windows MIDI
timing is as tight as it ever was on the Atari.

i thought the A1000 came with 256k while the A500 had 512k?? and it was a repackaged A2000 not a A1000 then - i think the 500 and 2000 both
had later version ROMs and WB right?? but all 3 were pretty identical - it was with the A3000 that Commodore came out with the ECS chipset
and the 2.0 ROMs and WB.. im not sure but i think thats the progression..

> The different Amiga models have been different enough to warrant being different models, but they're all Amigas.

i thought the general consensus was that there wasnt enough difference - hence the AGA 1200 and 4000 being too little too late.. Commodore
sticking with a 7MHz processor for over 5 years and all.. dont get me wrong i still love and have owned just about all of them at one time
or another..

4194. CLI in an ACC?

Newsgroup: comp.sys.atari.st
Date: 2000-03-27 00:00:00 UTC
From: vdjole@EUnet.yu
Message-ID: <8bo5iv$q78$1@SOLAIR2.EUnet.yu>
Source record: 63707

For years I have used a little accessory program (named simply SHELL.ACC), dated as far back as 1986, which is a basic command-line-interpreter- useful when one remembers to do something from within an application, or even activate another TOS program. I don't remember now where I obtained it, is it public domain or not. It did what it was supposed to do, so I have not wondered much about its obsolescence or otherwise (though I noticed that it clashed with some applcations), or is there something better with that functionality.

Several days ago I stumbled across a LIMITED DEMO of another CLI accessory named COMMAND! (exclamation mark being part of the name). It was made ten years ago by "Intrinsic Software" and it does about the same things as the one I have, except that it does that nicely in a window, instead of on full screen.

So, does anybody know has this nice COMMAND! accessory (full version) by any chance (being old, and all that) been made public domain meanwhile, or is there some other (newer) ACC or CPX that is PD and has similar functionality. And, of course, where can such a thing be found?

Thanx in advance.

PS: I suppose that someone might suggest using a multitasking OS and some sophisticated shell, but that would be an overkill and not really practical for everyday use on a 8MHz/4MB Mega.

>>or VMS as a standard operating system...
>
>Again, it looks like you're looking for something else to dominate rather
>than looking for diversification.

Hi, Terry;

It seems that the phrasing of my last message was very unfortunate and unwise, and yes, it really reads as if I wanted something else to dominate- but that is not what I meant at all! I wanted to express something of a feeling that the pruning of the branches on the home-computer evolution tree has, perhaps, happened too early and maybe not always to the benefit of the most promising ones. I am aware of a need for standardisation, but maybe the evolutionary chaos should have reigned a litle bit longer.

I have no particular liking (or disliking) for the VME bus- in fact I have never used a VME-equipped device in my life; that was just an example of something that might have happened differently, but didn't.

It is about the same for SCSI/IDE- Martin Graiter has just said that they are not too different. I think that the slight advantages of SCSI that he mentioned might have better qualified SCSI than IDE for general use, but instead SCSI is regarded as a somewhat exotic solution for higher-performance systems, isn't it. But maybe it is not too important.

>You still have Ataris and Macs.

Indeed. It is good that atl least there are both of them- though the weird pricing policy of Apple has made Macs much less of a competition than they should be. However good a Mac may be, it can't be so good as to be three times more expensive.

>You have many, many different types of PCs.
>You have different types of laptops and handhelds.
>[...]
>and many different motherboards, hardware add-ons, etc..

Yet they all seem quite similar to me- (almost) the same processor, same bus, etc. But I don't use PCs much, so maybe I can't recognize the subtle differences (who was he that said "to a sheep, another sheep no doubt

seem different"?)

>don't see this loss of diversification. If Atari was the dominant platform,
>would you still be worried about diversification? Judging from your
>comments above, probably not.

But I think I would be. Frankly, I would have preferred a computer
running VMS with a nice GUI :) Though, nowdays maybe it would be best to
wish for a QNX machine. Btw. relating to DEC, some PDP-11 computers once had
a layout that may probably look comfortable even today for those who like
modularity: a passive backplane, while CPU, memory, interfaces and
everytyhing else were on separate little boards plugged into the backplane
(probably not very convenient for today's high speeds, though...)

I am aware of Atari's limitation in speed, video and a limited OS.
Yet it is such a compact, simple, handsome pet...

It seems that some unbelievably unwise design and marketing decisions
of both Atari and Commodore will remain an eternal source of wonder...

Btw. as far as I know, Amiga did have quite unspectacular graphics at the
beginning, too, didn't it? But it has advanced faster, later on.

See below. I said in my original message:
>>Does anyone have any instructions about the new hotlist in CAB 2.7 -
>>English or German? If so, any chance of a copy, please?

Your 'partner' Dennis has been kind enough to send me the German HYP for
CAB 2.7. I haven't had time to read it all, but it has solved the above
problem. The relevant bit translates as:

There are small icons before each entry (in the hotlist). A diskette
icon means that the URL points to a file on the hard disk, a globe
that it points to a URL in the WWW. In front of these icons there is a
further marker, which can be switched on/off with a mouse-click. The
module for checking the hotlist will only check those entries for which
this marker is switched on.

Why SySol couldn't have included this in their manual is beyond me...

>
>You've just answered your own question. The difference between a TOS and a
>PRG is that PRG (and APP) use GEM.

Also, IIRC some of the early operating systems only allow *.TOS programs
in the AUTO folder, not *.PRGs.

The practical effect is that *.TOS applications tend to write directly
to the screen (though diverted to a VT52 window by MagiC) and of course
need keyboard input of some kind if any options are offered.

For the sake of completeness, not all *.TOS files are applications in
their own right. This extender is also used for self-extracting archive
files - a double-click extracts the archive to disk, so the user need
not have an archiver program.

i remember seeing an Atari (this was post 2600) that looked like a computer (A500ish) but with colorful buttons on it (i think it the chassis was white though) and it was hyped as an interactive console - like you wouldnt need to go out and buy any games because you could just make your own.. my memories of this are very vague but do you know what im talking about?? to be honest i remember wanting it quite bad (i think i was still playing my 2600 at home at the time and i was quite smitten with Atari - their logo still kicks ass)..

as long as were talking about things best forgotten - i was mucking around a surplus store and i found a Commodore Colt.. any idea what that was?? thanks!!

Now that is just the opposite of my experience. With cdp.app I never
noticed any slow downs and never have had any bus error or whatever.
Note I'm using betaDOS with spin.xfs (MiNT driver).

PlayMyCD has sofar never crashed but again it slow downs other programs.
Furthermore the popups of PlayMYCD doesn't come up smootly.
I just wonder why my HD is spinning as long as PlyMyCD is playing a CD. I
don't like this and I don't this is very healthy for my HD too.

>Until Dan gets it sorted (though he thinks its StiNG's fault rather than
>the OVL), I'll just have to change to Olivier's whenever I need to check
>the DHS site.

Have tried the version 1.4004 today and the DHS site seems to load
fine atm - like you I found it wouldn't work before. The cookie
time/expiry date seems to work for Egroups but not for Onelist, still
circa 1970 on checking.

>Anyone know if I can change to OVL whilst Cab is loaded, or do I have to
>quit out, change them over, and reload Cab?

As far as I know (I may be wrong) but the OVL version is initialised
as part of the start up sequence of CAB so I would assume CAB must be
restarted to use another OVL - I've tried here with no luck.

Thanks *again* to Dan for his time spent on this.

Cheers
Sean

4207. Seeking Atari ST computer

Newsgroup: comp.sys.atari.st
Date: 2000-03-27 00:00:00 UTC
From: Mike Chandler <zonk579@IHATESPAMannex.com>
Message-ID: <FPOD4.6447$p_6.200318@newsread2.prod.itd.earthlink.net>
Source record: 63720

Can someone tell me where I might be able to find a reasonably priced Atari ST computer? I was an Atari 8bit enthusiast for years and have been dying to try the ST.

Does anyone have one for sale or know where I might buy one?

Thanks,

Mike Chandler

NOTE: If replying by email, remove the 'IHATESPAM' portion of my address before sending the message ;)

4208. PAY PAL

Hi All,
Anyone here familiar with PAY PAL E-mail payment method? If so, is it secure and safe enough to use. It might be handy in buying Atari software from overseas sites needing foreign currency or which have innaccessable credit card pages using CAB!. USPS is a pain in the butt when it comes to International money orders made out in UKP, etc.!
John G.

4209. Need ST 520 parts

I have been slowly putting together a 520 system. Currently I have:
520 CPU case w/KB
monitor w/cable
mouse
floppy disk drive w/PS

What I DON'T have is:
System PS (looks to be a DIN 5 connector)
floppy drive data/signal cable (DIN 14)

I have other Atari adaptors for trade and loads of PC and Mac stuff for trade. I can pay for the cable and PS as well. I live in Maryland near Washington DC.

MC> Can someone tell me where I might be able to find a reasonably
MC> priced Atari ST computer?

Can I tempt you with my STe?

The time has come for a new owner for the Bear Cavern BBS's equipment.

The following Atari equipment and software are for sale for $500 plus
handling and shipping.

Optional: Will include an APC BackUPs 400 UPS for an additional $40 plus
handling and shipping.

1 Atari Mega 4 STe equipt with 50 MB hard drive, Ajax chip, 1.44 floppy
drive. With a JinMouse (better than an Atari Mouse).

1 Atari 14" swivel base monochrome monitors.

1 Atari SC1224 color monitor.

1 1.1 Gigabit Seagate SCSI Toad Tower Hard Drive with Adaptic card.
Built in the same box, a Viper 150 (uses 250 mb tapes) Tape Drive.
This hard drive is the one used with the BBS and contains several hundred
Atari, MSDOS and Windows files.

1 540 MB Quantum hard drive with an ICD II adapter.
Built in the same box, a Viper 150 (uses 250 mb tapes) Tape Drive.
Built in the same box, a 750 kb floppy drive. The floppy is good but the
cord length makes it unreliable. Best to remove it and use it as intended.

The BBS software is BB/ST by Quantum Microsystems. Old but reliable.
The program has been improved by Anthony Watson (Mountain Software),
improving the file library and the File attached Mail.

Maintenance software on the BBS includes, Diamond Edge, Diamond Back, ICD Pro
Utilities, SCSIWAIT 3.

Two external SupraFAXmodems, 1 v32.bis and the other 33.6 (these are the ones
with the display)

Dozens, if not hundreds of 750 kb disks with commercial software, Magazine
files, and STReports downloads and manuals. (Also the Best Electronics
catalog).

Cords, powered monitor switch (will switch from one monitor to another
including the AC)

Mega STe Field Manual

Lots of software

On 2000-3-27, Terry May <outrider@lvcm.com> wrote:

> Wasn't SCSI around long before IDE, and in fact is still around?

SCSI is older, but was designed with expansion in mind.
IDE is mainly a direct TTL-level interface to the hard-disk.

> If IDE has become the dominant interface, it isn't because
> SCSI never got a chance. It's because apparently the market
> has made it dominant, because of price or ease of use or
> whatever.

Price and ease of interfacing. SCSI is somewhat more involved.

Think of IDE as plugging a light bulb straight onto a battery.

SCSI is equal to turning the light on through a series of relay
switches. Needless to say, the relay situation is costlier and
more involved, but it allows controlling several more devices
than a single battery can handle and doing so in an ordered
method, while IDE is a straight ON/OFF switch, so to speak.

:) Hi!

Isn't this a bit like telling people the Atari is a 8mhz computer with 256k ram, and the Amiga is a 68040 based computer with 64mb ram + internal 38 gig HD and 24 bit sound & graphics?

OK then, the PC is a 4mhz 8088 based system with no internal harddrive..

:-)

Hi!

I agree - the PC has better or equally good timing IF you manage to find the right combination of hardware. However this is not allways very easy. Even when you have a good soundcard you can get bad timing with some motherboards.. Quite strange. The best I've come across so far is a midiinterface for the parallellport, and that's a bit odd when parallellport devices usually hogs the CPU completely...
I also get better timing then I run my old 16 bit Cubase v2.8 in Windows 3.11 (!)

/Peter

> It's absolutely true. Windows has absolutely no real-time functionality, so
> programmers cannot use the system to launch real-time events like MIDI. They
> have to work around this by programming their own routines, which is messy
> and leads to instability.

In the dark ages, PC's couldn't cope with midi or midi/audio sync - but today, it's a whole new ballgame.
You need somewhat more knowledge to put together a PC that works well with midi than you need with an Atari, but it's really no big deal. Avoid cheap soundcards and use a dedicated midi interface - either as a separate card or a unit connected to a serial or USB port (but not integrated on the soundcard). There's your perfect midi sync that's just as tight as on any Atari machine.
There's still the well known SoundBlaster problem, with extremely poor midi timing and midi/audio sync. This is due to the soundcard and not to Windows. After all, Cubase VST is developed for the Windows 95/98 environment and works very well there, so with real soundcards and midi interfaces, the PC

is really much better than any Atari.

The long-lived myth of the great Atari midi sync isn't a myth, but modern PC's with the real hardware are at least as good as Atari machines - if not even better.
After I changed to PC (with Windows 95 and then 98 and no crashes so far), I've tested playback of 20 copies of the same stereo track of audio simultaneously from the same stereo output, which was performed without any phasing/flanging/chorus effect (another name is "sample accurate sync"). With the Falcon, you can't even play two mono tracks of audio with the same content without getting such faults.

I've loved my Falcon for about 7 years or so (and other Ataris for several years before that) and I've made many recordings which sound very well, but I eventually decided that I wanted to use a platfom where spare parts and accessories are easily found and where professional software is still being developed, so I moved to the PC as I believe the future is not located on the over-priced Mac platform due to the difference in market shares (I didn't want to bet on a loosing horse and risk loosing a lot of money spent on equipment noone wants to buy if the time comes to change platform again...).

The Falcon is very limited compared to the PC system I have now, but it's sufficient for most home studios and it's MUCH better than a reel tape or a portastudio, so getting a used Falcon with Cubase Audio is like coming to heaven if you're using tape for the moment - but if you want the latest features, like high quality plugin effects, plugin synths, more than 8 DAT-quality audio tracks, 24-bit recording instead of 16-bit etc, you should absolutely go for a PC instead.

> > If so, then why do "proffessional" studios use PC's?
> > Are Macs just as bad? Whats the truth here?
>
> Most studios use Macs, which are not as bad as PCs, but still a compromise.

I've tried both Mac's and PC's and I must say that the top notch PC's perform much better and faster in real life than top notch Mac's - and besides, most studios I know of actually use PC's - but even so, they still keep an old ST or Falcon sitting in a corner since many musicians still use them... ;)

the amiga drives only have a very small difference and you can use any
standard drive with a small interface. it's called shutgate interface
or similar. i don't know what it does but it can't be much since
most of these have very little electronic stuff.

Graham.

I uses the computer for almost 3 hours last night playing CD's all the
time with no slowdown what so ever. PlayMyCD did great. When I have
gotten the slowdown, while typing in the contents of a CD, the PlayMyCD
changes screans. It acts like there is no CD in the CD player and is
asking me to insert one. Of course if I play the Cd while I am doing
the typing, no slowdown appears.

There is no method that I know of currently to change an OVL on
the fly. It would be posible to do something like this, but you would
need a program in between CAB and the OVL to really make it work without
rewritting CAB and the OVL's. If someone is interested in the idea I can
give them information on the direction one would need to go in writting
this utility. But I personally don't have time for it.

I don't know about Command! or Shell.acc, but Gribnif Software used to sell a CLI called Neodesk CLI. It ran as a desk accessory and in a window. As I recall it was quite powerful. I just checked their web site, http://www4.pair.com/gribnif/ , but I don't see it listed. You can always email them and see what the status is.

I used to used to have it loaded all the time, as a companion to Neodesk, my preferred desktop alternative.

And I ran it on a Mega 4, no multitasking OS.

If you're actually talking about HDDriver, the answer is that it probably
won't make a ha'porth of difference. Just to clarify your message, you are
trying to PARTITION the drive, rather than format (a quick way to ruin it,
by all accounts!)

Also take on board the previous advice about CPX's, you only need
serial.cpx and the sting.cpx (set to "active").

If your ISP is using CHAP then you're on a loser.

Hi,
This is heavily pro-PC, but when people say things that aren't true, I simply have to react...

> > I was always wondering if the BAD Midi timing thing on PC's was a Myth or
> > reality. I was told that Atari has the tightest midi timing, so that
> > is ONE reson I use Atari for Midi. (the other is all the cool Midi S/W
> > you can't find anywher else) So is this MYTH or REALITY: Midi timing ,
> > even on our modern day PC's?
>
> It's absolutely true. Windows has absolutely no real-time functionality, so
> programmers cannot use the system to launch real-time events like MIDI. They
> have to work around this by programming their own routines, which is messy
> and leads to instability.

In the dark ages, PC's couldn't cope with midi or midi/audio sync - but today, it's a whole new ballgame.
You need somewhat more knowledge to put together a PC that works well with midi than you need with an Atari, but it's really no big deal. Avoid cheap soundcards and use a dedicated midi interface - either as a separate card or a unit connected to a serial or USB port (but not integrated on the soundcard). There's your perfect midi sync that's just as tight as on any Atari machine.
There's still the well known SoundBlaster problem, with extremely poor midi timing and midi/audio sync. This is due to the soundcard and not to Windows. After all, Cubase VST is developed for the Windows 95/98 environment and works very well there, so with real soundcards and midi interfaces, the PC is really much better than any Atari.

The long-lived myth of the great Atari midi sync isn't a myth, but modern PC's with the real hardware are at least as good as Atari machines - if not even better.
After I changed to PC (with Windows 95 and then 98 and no crashes so far), I've tested playback of 20 copies of the same stereo track of audio simultaneously from the same stereo output, which was performed without any phasing/flanging/chorus effect (another name is "sample accurate sync"). With the Falcon, you can't even play two mono tracks of audio with the same content without getting such faults.

I've loved my Falcon for about 7 years or so (and other Ataris for several years before that) and I've made many recordings which sound very well, but I eventually decided that I wanted to use a platfom where spare parts and accessories are easily found and where professional software is still being developed, so I moved to the PC as I believe the future is not located on the over-priced Mac platform due to the difference in market shares (I didn't want to bet on a loosing horse and risk loosing a lot of money spent on equipment noone wants to buy if the time comes to change platform again...).

The Falcon is very limited compared to the PC system I have now, but it's sufficient for most home studios and it's MUCH better than a reel tape or a portastudio, so getting a used Falcon with Cubase Audio is like coming to heaven if you're using tape for the moment - but

if you want the latest features, like high quality plugin effects, plugin synths, more than 8 DAT-quality audio tracks, 24-bit recording instead of 16-bit etc, you should absolutely go for a PC instead.

> > If so, then why do "proffessional" studios use PC's?
> > Are Macs just as bad? Whats the truth here?
>
> Most studios use Macs, which are not as bad as PCs, but still a compromise.

I've tried both Mac's and PC's and I must say that the top notch PC's perform much better and faster in real life than top notch Mac's - and besides, most studios I know of actually use PC's - but even so, they still keep an old ST or Falcon sitting in a corner since many musicians still use them... ;)

It worked! Thank you all! Thank you! Thank you! Thank you! Thank you!
I now have access to my hard drive! Thanks to everyone who offered help.
The ahdi.prg did not help, it did not work. What did work was using the
ICDBOOT.PRG I had tried pressing all kinds of keys and stuff but none
of that worked. But the ICDBOOT.PRG was the only thing that worked.
Thanks all of you!

Now I need to know which of these programs I really need and what order
to place them in the AUTO folder: (these programs were in my auto folder)

CACHE100.PRG
DRVIN.PRG
FIX_GDOS.PRG
FOLDR200.PRG
GDOS.PRG
MFP.PRG
POOLFIX4.PRG
SETTER.TTP
TOS14FIX.PRG

Thanks again for all the help!

Message-ID: <RkCD4.3373$na.232699@newsread1.prod.itd.earthlink.net>
Source record: 63831

Mario Becroft sent me the following info to an inquiry regarding his VME graphics card project:

"No progress yet. I expect to be receiving the troublesome chips very soon that have been preventing me from proceeding with the project. In fact I will send an email off in a few minutes and check whether they are on the way...

I am making progress again on my SCSI Ethernet adapter at least, and once the graphics card chips arrive I hope that I can get that finished quite soon too. Everything else is ready...

Well it is taking longer than I ever imagined but I will get there! "

So if anyone is really serious about a card for their machines - you might do well and contact Mario and let him know.

> mixing and such tasks.

Almost, but not exactly. The Z80 (@~4MHz) is a sound processor, not
generator. It controls a TI76489 Programmable Sound Generator (4 DACs with
8k of RAM I think) and a Yamaha YM 2612 (6 stereo FM channels). The 68000
can also control these if necessary.

Stuff by Yuzo Koshiro is the best stuff I've heard from the Megadrive. Try
Streets Of Rage 1+2.

You can say that "real" Macs disappeared wehn Mac OS stopped
supporting the 68k line, which was around 7.6.x (cannot remember
the exact version off-hand).

From: sphaero@my-deja.com
Message-ID: <8bn7ckcsv1@nnrp1.deja.com>
Source record: 63837

Hi there,

I've recently built my Atari in a new case but I wanted to use my external diskdrive as an internal diskdrive. I was able to just connect it to the internal diskdrive port but it refused to work. I found out that the diskdrive is different from the original internal one. Is it possible to connect that external drive to the internal connector or are the diskdrives just totally different. That would be strange since the drive was connected to the external diskdrive port. There are jumpers on the diskdrive (ds0,ds1,ds2,mm,dc... etc.) but I don't know what they're doing. Anyone any suggestions???

Rg,

Arnaud.

4242. Atari ST SCSI Controller

Newsgroup: comp.sys.atari.st
Date: 2000-03-27 00:00:00 UTC
From: sphaero@my-deja.com
Message-ID: <8bn82odgp1@nnrp1.deja.com>
Source record: 63839

Hi there,

I think I just blew up my ICD SCSI controller... Has anyone any ideas
if it's possible to fix a SCSI controller. If someone has a spare one
for sale please mail me. My atari is nothing without a scsi controller.

Rg,

Arnaud

Sent via Deja.com http://www.deja.com/
Before you buy.

> what they're doing. Anyone any suggestions???
>

Hi

Theorectically it is possible to have 2 drives running from the internal
drive connector as they are both supposed to be connected in parallel to
each other.

The jumpers you have mentioned are the drive ID jumpers, to use the external
one as the internal you must make sure it's ds0 (for drive 1).

Some external drive twist a couple of the wires on the Schugart interface
around so that the drive will work as ds0 but be read as ds1 by the
computer.

As long as the replacement, or the drive you are trying to use has a
Schugart interface (which 99% of drives have now) and is a double density
(720k) you shouldn't have too much of a problem; if it's a high density and
your machine doesn't support that type then you will need a slight hardware
modification.

If I can help further, don't hesitat to contact me: steve@atari.org :)

Hi

You have to get an added memory board, V - E - R - Y expensive.

For what I can gather you will also need TOS 2.06 to access the extra memory
and it's possible to go to 16meg..

Hopefully other details will be posted here, as I'd very much be interested
inthis area.

Aixit's Magnum ST card will take you up to about 12Mb or so, not sure if
it's still available. Maybe someone might have a secondhand one.

You'll need either TOS2.06 or MagiC.

Actually GDOS works fine with NVDI 2.5 but only after some
experimentation which ended up with me having a separate Timeworks
dedicated AUTO folder and Assign.Sys file. Timeworks will not work with
Magic because of the file selector.

To use it therefore I have a Timeworks mode, i.e. take off Magic and swop
the AUTO folder and Assign.Sys files and reboot, bit of a pain but at
least I can still use it.

I think others will assure you that I can be trusted! I often get private
e-mails in response to a query, it's the way this group often seems to
work and personally I think it's good.

Do you want the program? Since it doesn't use your AUTO folder it
automatically works in Single TOS.

If I am not mistaken it also requires a secure connection - which leaves out
CAB under TOS or MagiC.

What a load of crap. What's the point in worrying about whether or
not the CPU is being run in hardware or software? It's just a technical
issue, and has no bearing on what's run on it.

This Mac G4 is still running all of the old applications that was run
on the PowerMac before it, and the Mac Quadra before that. It also has
the same scanner, Jaz Drive, External HDD and CD-Writer that the previous
machine used.

The only practical difference is that everything goes a whole heap
faster, (except the Jaz, which was always a load of crap) :) and I can
run additional (PowerPC) software.

If you're gonna pick on the CPU, are you going to say the Quadra was
suddenly a non-Mac when the PPC card was put in it? From a users point
of view, it was no real different to putting an 030 card and fast-memory
into my a1200 - except the Mac (ironically) enjoyed better compatibility
through the upgrade.

The only actual difference between these two cases was the addtional
software layer in the Mac. ...Sorry, I'm still going to call it a Mac.
:) So you just sit down over there and keep telling us how it isn't
real a Mac, and we'll just keep using all the same software and hardware
as we did on the other Mac.

Footnote:
More irony for ya: The only real incompatibility we've found so far
was due to the *software* transition from MacOS 8.6 to 9.0. But that
was just in the *real* old Excel 5. We'll just use Excel'98 instead.
(Assuming we have your permission to call that Excel.) :)

> > which was around 7.6.x (cannot remember the exact version off-hand).
>
> MacOS 8.0 supports 68k. I use it with emulator on my Amiga...
> I think 68k was dropped at OS 8.5.

Yup. I've seen OS 8.1 running on an a4000 with Fusion. I know
8.6 is PPC only. (Never saw 8.5) 9.0 I wouldn't *dare* to run on
a 68k, even if it was possible. (It's a bit of a bloated beast.
...Made some of our old PPC's crawl.) :/

Nathan.

I looked at this for future purchases of Jagaur games, I may be wrong here but the impressions I got was that they would only pay out to US residents which would prevent non US residents from being able to sell, but would allow non US customers to buy, after all they only have to charge your credit card and so it does not really matter where you are.

Is this correct or is it soley for US Buyers and Sellers?, I know that they have recently merged with another company, does this comapny deal internationally? and if so can you get them to forward payment ot Pay Pal sellers?.

That was the Atari XEGS (XE Game System). It was compatible with the Atari 800/800XL/130XE (The 8bit series).

4275. 520ST Good for anything year 2000?

Newsgroup: comp.sys.atari.st
Date: 2000-03-28 00:00:00 UTC
From: K I□ronside <ironside@nbnet.nb.ca>
Message-ID: <3y4E4.5851$oQ4.173777@sodalite.nbnet.nb.ca>
Source record: 63662

I'm cleaning out an old corner of the office and ran into my old 520 ST

Here's is specs
--2.5 meg ram (though I think it can be upgraded on the same card to 4 meg, presuming the old memory chips are still available)

-- two monitors, one B/W the other color

-- 720 k internal, 320 k external

-- 30 meg scsi hardrive with ICD controller in old XT case

-- Spectre 128 cart with Mac Roms (it ran as a Mac for the last two years of its life cycle)

-- 1200 baud modem (though I have another spare 14.4 somewhere)

Two questions:
Is it worth putting any time or money into? Or are any of the parts worth the hassle of listing and shipping?

What sort of profitable (cost effective) uses could it still have.

(note: I long ago went over to the "dark side" and bought a Mac Power PC)

Any constructive input would be appreciated

Yep, I cleared out all resident cookies before using the new OVL.
Strangely "Egroups" registered ok but "Onelist" still caused a
problem - although _one_ of the cookies *did* have the correct date.
I'll try again and see what happens.

Cheers
Sean

If it's a SIMM based RAM board or an STE, you'll find plenty of them on ebay
and places like that.

> -- two monitors, one B/W the other color

B/W for serious apps only. Colour for games only. Which to use depends on
what you want to do.

> -- 720 k internal, 320 k external

The single sided one is rather useless

1200 is useless nowadays. Makes a nice doorstop though.

> Two questions:
> Is it worth putting any time or money into? Or are any of the parts worth
> the hassle of listing and shipping?

It all depends if you want to use it. It makes a nice break from your "dark
side" machine. You could definitely sell it, as it's a nice setup for an
Atari (especially the HD and Spectre are sought for items).

> What sort of profitable (cost effective) uses could it still have.

You could do light word processing, net surfing (slow, but feasible), email
and usenet. It's still a very efficient platform for MIDI applications and
DTP, although for the latter it might be a bit slow. It would also make a
nice games machine, attached to a TV or to the colour monitor.

Hm. I don't have the latest Extendos but with the one I've I notice the
same problems. I also tried MetaDOS in singletasking mode. Still the same.
Something is constantly accessing my HD. For me this doesn't look very
healty.
For some reason (probably configuration problem) I couldn't access my CD
under Geneva with extenDOS or MetaDOS. However with freeMiNT loaded on top
of Geneva I notice again HD accessing and program slow down.

Source record: 63673

Where can I get 14MB for my 1040STE?
What is a TAB upgrade board?

Inspect the TAB upgrade board for any physical signs of damage or any bad solder joints. This is just a precautionary measure. The boards are inspected before packaging, but damage may occur afterwards.These instructions assume that you are familiar with the computer and its components and have the computer already disassembled.

Installation Instructions
1. Locate the GLUE chip (CO25915) and cut the traces going to pins 4,5,6,7,8. There may be only one trace going to each pin or there may be 2, depending on the motherboard that you have. These are the A16-A20 address lines respectively. Each one only goes from the 68000 CPU to the GLUE and MMU (CO25912). On some motherboards, the lines come from the CPU to the MMU and then on to the GLUE. In this case there should be only 1 trace to each of the 5 pins on the GLUE chip. On other motherboards, the lines come from the CPU to the GLUE and then on to the MMU. In this case there will be 2 traces to each of these pins (probably 1 on top and 1 on bottom) and both must be cut. In essence, the pins 4-8 at the GLUE need to be taken out of the circuit. Isolated and open. Nothing connected to them. Refer to drawings in back.

2. If you had to cut more than 5 traces, then you must jumper the A16-A20 address lines to the MMU from the CPU. A16-A20 are pins 44-48 on the CPU respectively and go to pins 11-15 on the MMU respectively. Do this on the bottom side of the motherboard. Use 26-30 guage tinned wire. If you only had to cut 5 traces, then no jumpers are required. Refer to drawings in back for a visual aid.

3. If available, use an ohm meter to check the continuity between the CPU and MMU, and check that there is no continuity to the pins of the GLUE.

4. Locate a suitable place to position the TAB board and fan the first 7 wires to reach pins 44-53 of the CPU. Fan the next 3 wires (8-10) to reach the last TOS rom in your system. Fan the last 6 wires (11-16) to reach the GLUE.NOTE: Cut all wires as short as possible to reach their termination point, within reason. No banjo strings please.

5. Connect wire 1 (the red one) to the capacitor going to pin 1 (+5v) of GLUE.

6. Connect wires 2-7 to CPU pins 44-48, and 52 respectively.

7. Connect wires 11-15 to GLUE pins 4-8 respectively.

8. Connect wire 16 to the other side of the capacitor where you connected wire 1.

9. It's a good idea to test the computer at this point. Place the motherboard where you would normally place your computer. Make sure it is on a non conductive surface. Connect monitor, power supply, keyboard, and optionally your disk drive and turn the power on. The computer should boot as it would before anything else was done, unless you don't hook up the disk drive, then it will take a little longer and go to the desktop without any icons.

If all is well, proceed to next step.

10. Remove the 6 TOS roms chips, and note where they were installed for later reference. If you have the 2 chip rom set, simply remove the old roms and plug the new roms into the sockets, and skip instructions 11-15.

11. On the 128K x 8 bit roms (2.06) strap and solder pins 1,32,31, and 30 together. Bend out pins 2 and 3 to about a 45 degree angle.

12. Install the EO rom in the socket where you removed chip CO26165 (TOS 1.0).

13. Install the EE rom in the socket where you removed chip CO26162 (TOS 1.0).NOTE: Make sure that the exposed 5 pins (1,2,3,31,32) do not short out to anything.

14. Connect wire 8 to pin 3 of both new roms.

15. Connect wire 9 to pin 2 of both new roms.NOTE: Wire 10 does not get connected. It is a spare.

16. Test computer as in step 9. On power up, the Atari logo should appear and after an added delay (for a hard disk to come up to speed) it should start a memory test. Press escape key to bypass the memory test.

17. If all is well, reassemble computer, or proceed to dual TOS optional instructions.Dual TOS Instructions (Optional)If for one reason or another you want to be able to switch between the new TOS and the old TOS the following is required. Do the normal installation FIRST. Then follow the following instructions.

NOTE: If your rom chips are under the power supply, you will have to find some way to raise the power supply about 1/2 inch, or you will have to remove the sockets the dual roms go into and solder the original roms to the motherboard. If you raise the power supply, the case will have to be cut for the plug and power switch. Also the top cover may not fit good and the extra heat closer to the plastic could cause the plastic to melt. You will also probably need to modify your top shield. In other systems check the clearances BEFORE you proceed with these instructions.

A. 6 chip set instructions

1. Remove the new roms from the sockets (do not disconnect wires) and install your old roms back in the sockets, but bending pin 20 of both old roms out.

2. Piggyback the new roms on top of the old roms with the exception of pins 3 and 22. These pins should line up with pins 1 and 20 of the old roms respectively. It may be easier to piggyback the roms out of the sockets.NOTE: Pins 20 of the old roms and pins 22 of the new roms are the active low chip select pins and if not in use must be pulled high.

3. Strap the old roms pins 20 together and connect to +5V through a 10K ohm resistor.

4. Strap the new roms pins 22 together and connect to +5V through a 10K ohm resistor.

5. Wire the center post of a SPDT toggle switch to pin 20 of one of the old rom sockets.

6. Wire one side of the switch to one of the pins 20 of the old roms.

7. Wire the other side of the switch to one of the pins 22 of the new roms.

8. Test computer as before. Flip the switch to change the TOS. DO NOT flip switch with POWER ON. If you do, the system WILL crash.

9. Reassemble computer, and mount toggle switch in an out of the way location to avoid accidental switching, but keep it as close to the roms as possible.

B. 2 chip set instructions

1. Remove the new roms from the sockets and install your old roms back in the sockets, but bending pin 22 of both old roms out.

2. Piggyback the new roms on top of the old roms with the exception of pin 22. It may be easier to piggyback the roms out of the sockets.

NOTE: Pin 22 of the roms are the active low chip select pins and if not in use must be pulled high.

3. Strap the old roms pins 22 together and connect to +5V through a 10K ohm resistor.

4. Strap the new roms pins 22 together and connect to +5V through a 10K ohm resistor.

5. Wire the center post of a SPDT toggle switch to pin 22 of one of the old rom sockets.

6. Wire one side of the switch to one of the pins 22 of the old roms.

7. Wire the other side of the switch to one of the pins 22 of the new roms.

8. Test computer as before. Flip the switch to change the TOS. DO NOT flip switch with POWER ON. If you do, the system WILL crash.

9. Reassemble computer, and mount toggle switch in an out of the way location to avoid accidental switching, but keep it as close to the roms as possible.

Problems

A. If your system doesn't work after you have installed the new roms, check the following.

1. Make sure the roms are plugged into the proper sockets. From pin 19 of the GLUE, you should have continuity to both roms pin 22. If not, you are in the wrong rom socket banks.

2. Also check that rom pin 24 of the E0 rom has continuity to GLUE pin 46. The EE rom pin 24 should have continuity to GLUE pin 47. If either of these is wrong, you are in the wrong socket.

3. The red wire from our board is wire #1, and count sequentially to 16 at the other side of the ribbon cable. Don't confuse wire number with the pin number on the plug. They DON'T match up. Wire 1 actually goes to pin 16, wire 2 goes to pin 1, etc. We ALWAYS refer to WIRE NUMBER.

4. Double check to make sure all wires are going to proper place and without shorts.

5. Did you test the computer at the suggested intervals. If not, back up and try to isolate the problem.

B. If you use the dual rom option and you are using a TV, and you experience RF interference, using a shielded cable to the switch will help. Ground the shield close to the connections to the roms. DO NOT connect shield to switch.It's more likely to be an

incorrect installation than a bad board. There just isn't much on our board to fail. We use FAST TTL logic when normal LS would work. The circuit is proven and rock solid. Check your installation again. We will repair or replace any defective board returned to us within 1 year of purchase.Refer to following drawings at back during installation.

TOS 2.06 FEATURES

This list of features has been compiled by us, and is intended as a guideline for using the new TOS. It IS NOT a complete description of the DESKTOP, or the TOS 2.06 operating system. It will mention some of the differences between TOS 1.0 & 2.06.

BOOT UP

On boot up, you will notice there is a delay. This is designed to give a hard disk a chance to come up to speed. So you can hook your hard disk & computer to the SAME power switch and turn them on at the same time now.

If you don't touch the keyboard on power up, the new TOS will perform a RAM & ROM test of the system. The time required for this depends on the amount of memory you have. To BYPASS this, simply hit your Esc key anytime after powerup.

NEWDESK.INF

The new TOS searches for 'NEWDESK.INF' on power up. If this is not found, it uses the old 'DESKTOP.INF' file. Once you are up and running, configure your desktop, and SAVE it. It will be saved as 'NEWDESK.INF'. If both files are kept on the boot disk, then it would be compatible with both the old and new TOS.You will notice some new commands under the top menu. Here are some brief explanations.

FILESEARCH: Will search the current drive for specified files.

DELETE ITEM: Will delete ALL highlighted items.

BOTTOM TO TOP: Will bring the bottom folder to the top.
SELECT ALL ITEMS: Will highlight ALL items in the current window.

SET FILE MASK: Window will show only files that match this file mask.

VIEWNO SORT: Shows files in th order they are actually in on the disk.

SIZE TO FIT: Will attempt to show all files in window, if ICONS are selected.

SET COLOR & STYLE: Set the color & hatch patterns for the windows & destop.

OPTIONSINSTALL ICON: Allows ICONS to be installed in window or desktop.

INSTALL APPLICATION: First HIGHLIGHT the application program. Allows you to install an application with many different parameters. To place on a function key, type Fn where it ask 'Install as:'. F11-F20 is using Shift + Fkey Click on 'Auto' if you want this program to run on bootup. Put document type (.TXT, .SRC, .ARC, etc.) in ONLY if you want this program to run ANY TIME you open one of these type files. Put in any arguments you want passed to the application when it is ran.

INSTALL DEVICES: Does a system check and installs icons for All devices found.

READ .INF FILE: As you may have guessed you can have as many different desktop configurations as you want. This let's you read a new one in.

CAUTION: When configuring your different desktops, rename the one you want to boot with temporarily. Any time you save the desktop, it's goes to 'NEWDESK.INF' and WILL overwrite the existing one. Once you have configured all your desktops, and changed their names to what you want, change the name of your original back to 'NEWDESK.INF'.

DESKTOP CONFIGURATION: Set your default directory (normally=applicaiton) and input params (normally=Full path). Shows your function key assignments, if any. And last but not least, lets you assign single keystrokes to do all the functions in the top menu. HELP KEYPress the help key to display many more keystroke features of the new TOS. You will learn more by playing with these than I could tell you in a few pages.

PUTTING FILES ON THE DESKTOPYou can now put ANY FILE right on the desktop. What does this mean? Well, once you put a file on the desktop, you won't have to open a window to run it. Simply highlight and drag the file out of the window and onto the desktop. Any time you want to run the file, just double click on the icon. No more going through windows to get to it. While the function keys are limited to 20 (F1-F20), this is limited to only the size of the desktop. You can have 32 icons on a medium res. screen. You can also put ANY file on the desktop, even folders. click on a destop folder and a window of that folder will open. You can also edit the shape of any icon on the desktop to more reflect what it is. REMEMBER to SAVE your desktop after ANY configuration change, or it will be lost the next time you boot.

XCONTROL.ACC AND CPX'SXCONTROL.ACC is the new control panel. It requires that the .CPX files be availible to it for it to run properly. They are in the CPX folder on the disk. Once installed, you will need to configure it. You may already have a control panel that you use, and XCONTROL.ACC IS NOT REQUIRED to use the new TOS. Try it and see if if works better for you than the one you are using. I have included several SHAREWARE programs on the disk. If you decide to use these, please contribute to the authors request.

--

Inspect the TAB upgrade board for any physical signs of damage or any bad solder joints. This is just a precautionary measure. The boards are inspected before packaging, but damage may occur afterwards.These instructions assume that you are familiar with the computer and its components and have the computer already disassembled.

Installation Instructions 1. Locate the GLUE chip (CO25915) and cut the traces going to pins 4,5,6,7,8. There may be only one trace going to each pin or there may be 2, depending on the motherboard that you have. These are the A16-A20 address lines respectively. Each one only goes from the 68000 CPU to the GLUE and MMU (CO25912). On some motherboards, the lines come from the CPU to the MMU and then on to the GLUE. In this case there should be only 1 trace to each of the 5 pins on the GLUE chip. On other motherboards, the lines come from the CPU to the GLUE and then on to the MMU. In this case there will be 2 traces to each of these pins (probably 1 on top and 1 on bottom) and both must be cut. In essence, the pins 4-8 at the GLUE need to be taken out of the circuit. Isolated and open. Nothing connected to them. Refer to drawings in back.

2. If you had to cut more than 5 traces, then you must jumper the A16-A20 address lines to the MMU from the CPU. A16-A20 are pins 44-48 on the CPU respectively and go to pins 11-15 on the MMU respectively. Do this on the bottom side of the motherboard. Use 26-30 guage tinned wire. If you only had to cut 5 traces, then no jumpers are required. Refer to drawings in back for a visual aid.

3. If available, use an ohm meter to check the continuity between the CPU and MMU, and check that there is no continuity to the pins of the GLUE.

4. Locate a suitable place to position the TAB board and fan the first 7 wires to reach pins 44-53 of the CPU. Fan the next 3 wires (8-10) to reach the last TOS rom in your system. Fan the last 6 wires (11-16) to reach the GLUE.NOTE: Cut all wires as short as possible to reach their termination point, within reason. No banjo strings please.

5. Connect wire 1 (the red one) to the capacitor going to pin 1 (+5v) of GLUE.

6. Connect wires 2-7 to CPU pins 44-48, and 52 respectively.

7. Connect wires 11-15 to GLUE pins 4-8 respectively.

8. Connect wire 16 to the other side of the capacitor where you connected wire 1.

9. It's a good idea to test the computer at this point. Place the motherboard where you would normally place your computer. Make sure it is on a non conductive surface. Connect monitor, power supply, keyboard, and optionally your disk drive and turn the power on. The computer should boot as it would before anything else was done, unless you don't hook up the disk drive, then it will take a little longer and go to the desktop without any icons. If all is well, proceed to next step.

10. Remove the 6 TOS roms chips, and note where they were installed for later reference. If you have the 2 chip rom set, simply remove the old roms and plug the new roms into the sockets, and skip instructions 11-15.

11. On the 128K x 8 bit roms (2.06) strap and solder pins 1,32,31, and 30 together. Bend out pins 2 and 3 to about a 45 degree angle.

12. Install the EO rom in the socket where you removed chip CO26165 (TOS 1.0).

13. Install the EE rom in the socket where you removed chip CO26162 (TOS 1.0).NOTE: Make sure that the exposed 5 pins (1,2,3,31,32) do not short out to anything.

14. Connect wire 8 to pin 3 of both new roms.

15. Connect wire 9 to pin 2 of both new roms.NOTE: Wire 10 does not get connected. It is a spare.

16. Test computer as in step 9. On power up, the Atari logo should appear and after an added delay (for a hard disk to come up to speed) it should start a memory test. Press escape key to bypass the memory test.

17. If all is well, reassemble computer, or proceed to dual TOS optional instructions.Dual TOS Instructions (Optional)If for one reason or another you want to be able to switch between the new TOS and the old TOS the following is required. Do the normal installation FIRST. Then follow the following instructions.

NOTE: If your rom chips are under the power supply, you will have to find some way to raise the power supply about 1/2 inch, or you will have to remove the sockets the dual roms go into and solder the original roms to the motherboard. If you raise the power supply, the case will have to be cut for the plug and power switch. Also the top cover may not fit good and the extra heat closer to the plastic could cause the plastic to melt. You will also probably need to modify your top shield. In other systems check the clearances BEFORE you proceed with these instructions.

A. 6 chip set instructions

1. Remove the new roms from the sockets (do not disconnect wires) and install your old roms back in the sockets, but bending pin 20 of both old roms out.

2. Piggyback the new roms on top of the old roms with the exception of pins 3 and 22. These pins should line up with pins 1 and 20 of the old roms respectively. It may be easier to piggyback the roms out of the sockets.NOTE: Pins 20 of the old roms and pins 22 of the new roms are the active low chip select pins and if not in use must be pulled high.

3. Strap the old roms pins 20 together and connect to +5V through a 10K ohm resistor.

4. Strap the new roms pins 22 together and connect to +5V through a 10K ohm resistor.

5. Wire the center post of a SPDT toggle switch to pin 20 of one of the old rom sockets.

6. Wire one side of the switch to one of the pins 20 of the old roms.

7. Wire the other side of the switch to one of the pins 22 of the new roms.

8. Test computer as before. Flip the switch to change the TOS. DO NOT flip switch with POWER ON. If you do, the system WILL crash.

9. Reassemble computer, and mount toggle switch in an out of the way location to avoid accidental switching, but keep it as close to the roms as possible.

B. 2 chip set instructions

1. Remove the new roms from the sockets and install your old roms back in the sockets, but bending pin 22 of both old roms out.

2. Piggyback the new roms on top of the old roms with the exception of pin 22. It may be easier to piggyback the roms out of the sockets.

NOTE: Pin 22 of the roms are the active low chip select pins and if not in use must be pulled high.

3. Strap the old roms pins 22 together and connect to +5V through a 10K ohm resistor.

4. Strap the new roms pins 22 together and connect to +5V through a 10K ohm resistor.

5. Wire the center post of a SPDT toggle switch to pin 22 of one of the old rom sockets.

6. Wire one side of the switch to one of the pins 22 of the old roms.

7. Wire the other side of the switch to one of the pins 22 of the new roms.

8. Test computer as before. Flip the switch to change the TOS. DO NOT flip switch with POWER ON. If you do, the system WILL crash.

9. Reassemble computer, and mount toggle switch in an out of the way location to avoid accidental switching, but keep it as close to the roms as possible.

Problems

A. If your system doesn't work after you have installed the new roms, check the following.

1. Make sure the roms are plugged into the proper sockets. From pin 19 of the GLUE, you should have continuity to both roms pin 22. If not, you are in the wrong rom socket banks.

2. Also check that rom pin 24 of the E0 rom has continuity to GLUE pin 46. The EE rom pin 24 should have continuity to GLUE pin 47. If either of these is wrong, you are in the wrong socket.

3. The red wire from our board is wire #1, and count sequentially to 16 at the other side of the ribbon cable. Don't confuse wire number with the pin number on the plug. They DON'T match up. Wire 1 actually goes to pin 16, wire 2 goes to pin 1, etc. We ALWAYS refer to WIRE NUMBER.

4. Double check to make sure all wires are going to proper place and without shorts.

5. Did you test the computer at the suggested intervals. If not, back up and try to isolate the problem.

B. If you use the dual rom option and you are using a TV, and you experience RF interference, using a shielded cable to the switch will help. Ground the shield close to the connections to the roms. DO NOT connect shield to switch.It's more likely to be an incorrect installation than a bad board. There just isn't much on our board to fail. We use FAST TTL logic when normal LS would work. The circuit is proven and rock solid. Check your installation again. We will repair or replace any defective board returned to us within 1 year of purchase.Refer to following drawings at back during installation.

TOS 2.06 FEATURES

This list of features has been compiled by us, and is intended as a guideline for using the new TOS. It IS NOT a complete description of the DESKTOP, or the TOS 2.06 operating system. It will mention some of the differences between TOS 1.0 & 2.06.

BOOT UP

On boot up, you will notice there is a delay. This is designed to give a hard disk a chance to come up to speed. So you can hook your hard disk & computer to the SAME power switch and turn them on at the same time now.

If you don't touch the keyboard on power up, the new TOS will perform a RAM & ROM test of the system. The time required for this depends on the amount of memory you have. To BYPASS this, simply hit your Esc key anytime after powerup.

NEWDESK.INF

The new TOS searches for 'NEWDESK.INF' on power up. If this is not found, it uses the old 'DESKTOP.INF' file. Once you are up and running, configure your desktop, and SAVE it. It will be saved as 'NEWDESK.INF'. If both files are kept on the boot disk, then it would be compatible with both the old and new TOS.You will notice some new commands under the top menu. Here are some brief explanations.

FILESEARCH: Will search the current drive for specified files.

DELETE ITEM: Will delete ALL highlighted items.

BOTTOM TO TOP: Will bring the bottom folder to the top. SELECT ALL ITEMS: Will highlight ALL items in the current window.

Is it possible to adjust the screen on the SM Mono monitors so it takes
up the full screen, mine is a little square in the centre.

Thanks

Well I found the reason. Onelist is sending a cookie that expires
in 1970. Probably just some trick to keep IE or Netscape from ever
expiring the cookie.

Hello,
Come and enjoy the historical event "World of Alternatives 2000" on June 10
and 11 in Neuss (near
Dï¿½sseldorf, Germany), historical because during this expo Atari and Amiga
will be under one roof !
Presented are the developper version of the Next-Generation-System
announced by Amiga and the revised version of the Milan II.
News about the (new, revised) Milan II can be found from 29-3-2000 on the
Milan website http://www.milan-computer.de
Info about the expo from 29-3-2000 on http://www.atari-messe.de
Cheers
Dan

They don't, and nothing is stopping you from using them (search
aminet for instructions if in doubt on how), the problem lies
with HD drives since the custom chip responsible for floppy disk
access (Paula, IIRC) can not handle the data rate delivered by
standard PC HD drives. As a result, all HD-drive-equipped Amigas
shipped with special drives that read at half the speed (i.e. DD
speed) and are now impossible to get by. There are hacks to make
standard HD drives work, but none of them are (to my knowledge)
overly reliable.

Regards,
Eike

If you use a floppy that follows the standard fully. I read somewhere
that some drives don't have the disk sensor or it is miswired (on
DOS/Windows machines they don't automatically check for a floppy so it
doesn't matter if it works there or not), so that the amiga can figure
out whether their is a disk in the drive or not, otherwise you have to
go through the mount/unmount steps that 5 1/4" drives need.

Also with HD drives you would have to disable the HD sensor so that it
is used only as a DD drive, since the chipset can only read from the
floppy at the DD speed. HD drives on the Amiga are special, they
reduce the rotation to 1/2 speed whenever using a high density disk.

Eric,

If you need an external power supply for your 520ST, I have both NEW and USED ones still available. You can have a NEW one for $15 or a used one for $5. Add $4.30 for Priority Mail Shipping within the continental U.S. Email me at s.winick@worldnet.att.net if interested.

I also have a floppy drive data cable available. Price is $5 (no additional shipping charge if ordered with the power supply, or add $3.20 for shipping if ordered separately).

Actually, the ST floppy format is only 720 k. You're referring to
non-standard formats, which are applicable on any platform, but of limited
usefulness.

: Wasn't SCSI around long before IDE, and in fact is still
around? If IDE has
: become the dominant interface, it isn't because SCSI never got
a chance.
: It's because apparently the market has made it dominant,
because of price or
: ease of use or whatever.
:
: Actually, USB will become the dominant external interface, if
it hasn't
: already. But again, it won't be because SCSI never got a
chance.

SCSI is a bus in it's own right. It is not only usable for harddisks but also for almost any other device that can be imagined to work well within the transfer rates of 5Mb/s-->40Mb/s. This is advantageous to the hardware developer since he can sell the same SCSI peripherals to different platforms. Provided there are drivers for each product and platform/OS, of course.

(E)IDE is a subset of the ISA bus from the PC world. All unnecessary signals are removed (for instance, all IRQ:s except 14 on one IDE channel and 15 on the other). The connector is the well-known 40-pin istead of the normal ISA connectors.

There's a difference in "talking to" sectors and tracks too. SCSI always uses LBA, which assigns a number from 0 (zero) to 2^32 to each sector, which gives a theoretical maximum capacity of 2 terabytes (2048Gb).

EIDE also uses LBA, but can also use other addressing modes. I believe that the LBA range on IDE is lesser, up to 2^28, which gives a theoretical max of 137Gb for an EIDE drive.

Both examples are for 512b sectors.

SCSI is more advantageous in very high performance systems, but not on any home system, not even super-duper double Pentium systems.

For the atarist there is no real difference. Possibly to the advantage for IDE, cheaper interface, cheaper and more available drives, *faster* on a CT2 Falcon! Maybe on a Nemesis Falcon as

well. SCSI is sensitive to correct termination, to different
levels of SCSI specs etc.

Sorry, but SCSI is overvaluated...

USB is a good idea, it has just become much faster in the new
specs.
All future bus trends point to very high speed serial
communications. The bus and the network will merge even on
motherboards. The Transputer was in line with this way of
thinking. Shame nothing more became of it!

Very true. It actually runs PowerMac OS, though Apple has chosen to
mislabel it as Mac OS.

> Or for that purpose, what do we make of my i386, Amiga 4000 and
> DECstation, all running NetBSD?

The hardware is what actually defines a computer platform, not the OS
or applications that run on it. Take the PC - it's always a PC whether
it has Messy-DOS, DR-DOS, Winslow, Linux, Unix, Quarterdeck, BeOS,
Netware or something else on it. The Amiga is still an Amiga, whether
you have Amiga OS, Linux, Unix, or another OS running on it.

Yes we do. Many years ago, Radio Shack had a sale on external
disk drives, so I got one for $99 (this was a really good deal
back then...). I then set a few jumpers, and got an interface
from a friend who made it for another $10 or so, and it worked
fine for years. (The Radio Shack sales guy didn't really want
to sell it to me though. "I don't think that will work with an
Amiga, will it? Well don't blame me if it blows up....")

So, an Amiga (say) running Fusion is a "real" Mac too. Yes?
That ought to end the argument about whether the next Amiga
will be a "real" Amiga. If it runs old Amiga stuff in emulation,
then it's a real Amiga. Glad that's settled! (Seriously.)

O.K., what I meant was to call your ISP with a terminal program (like Connect or Flash or Storm) to find out what the receiving computer was expecting. On my computer it's:

Username:

Password:

Thus STing has a script that has it wait for "Username", then wait 500ms, then print "atarigalen". The same is true for the password.

Now, you mention that you can't call out. Why not? If the modem works and you know what the host expects you should be able to make a connection (even if you then can't do anything with it).

>SETTER.TTP
>TOS14FIX.PRG
>
Assuming you have an ST:
CACHE100 -- optional, I think (I've never seen it before)
DRIVIN -- needed and must be before MFP
MFP -- needed
FOLDR200 -- optional, as it is a setting in ICDBOOT (run HDTOOLS
to see it)
POOLFIX -- haven't a clue
FIX_GDOS -- haven't a clue
GDOS -- this is your font driver. BTW, it's quite old.
SpeedoGDOS or NVDI are preferable.
SETTER -- what is this doing in your Auto folder? Take it out!
TOS14FIX -- Useful only if you have TOS 1.04

What I'd do in your position would be to make sure ICDBOOT has
extra folders turned on. Then put in GDOS, DRIVIN, and MFP in
your AUTO folder and the others in another folder of your
choosing. Then run your computer for a few months. If nothing
changed, you're O.K.. If something does look different, put in
the other AUTO programs one at a time until you find the one
you're missing.

BTW, TOS14FIX may or may not be needed...I used it for a while
but then upgraded to 1.62 Perhaps someone else could recommend
or not recommend its use?

both arguments are pretty flawed - i'd say the definitive answer of what truly
makes a machine unique is whatever logo is tattooed upon it when it first comes
out of the factory - its like a birthright - and there's no changing that..

>(I prefer not to use a TV)

Don't blame you about the TV. Mario Becroft has some hardware that may help. He has a device that allows any Atari computer to use most any PC monitors but only in the mono mode. He is also working on a VME graphics card that (I believe) hooks up to a PC monitor, His site is:

some will some won't, there are only a few tweekable pots inside get some TV
trimming tools (cheap little plastic things) and give it a try bit by bit ,
be careful though as there are some lethal voltages inside

What version of Gemulator and TOS are you using? The latest freeware version works perfectly well here with TOS 2.06, and I haven't noticed any date glitches.

> I was hoping to be able to use my SCSI HD drive that have all my Atari
> software installed, but until the date problem can be sorted out all its
> doing is gathering dust.

AFAIK, this isn't possible unless you partitioned the drive with BigDos or HD Driver beforehand. Windows can't read standard TOS partitions, regardless of the SCSI interface.

I checked out Pay Pal and there does'nt seem to be any international
restrictions. It seems like they act as a mediary between two customers
and has access to their credit card and/or bank accounts to credit or
withdraw either customer. Not sure if I like that!!! There was an option to
have a check sent from Pay Pal to the receiving party but I'm still not sure
if I like the idea of having my credit card availble to them at all times
(which is needed to sign up as a the paying party).

Hi
I have put on my webpage an English version of MJM - simple
e-mail client for Atari 1040ST (1MB RAM). It is thought to
be an alternative for Ant_Mail 0.7.9 for the users of standard
1040STs.
MJM supports MIME, Base64 *decoding*, has built-in viewer and
editor, does *not* need N.AES, AV_SERVER etc. You can create
up to nine user profiles.
Unlike previous versions, this one works ;)

A2000 not a A1000 then

Yeah, you're right. Someone punch me before I claim that the A1200 had
1.2 MB Ram, and that the A500+ is basically a cut-down version of the
A600...

> - i think the 500 and 2000 both
> had later version ROMs and WB right?? but all 3 were pretty identical - it was with > the
A3000 that Commodore came out with the ECS chipset

Yes, I think the A1000, A2000 and A500 all had the OCS chipset. Didn't
you have to load Kickstart from a disk before you could use the A1000?
(And I think it had WB1.2, but I don't know for sure when they upgraded
to WB1.3.)

>
> and the 2.0 ROMs and WB.. im not sure but i think thats the progression..

1200 and 4000 being too little too late.. Commodore

Well, I agree that they (at least the A1200) were too little too late,
but still they were "neccesary". Thanks to these models, the Amiga
extended it's commercial life a great deal. And, I think that most of us
who still use our Amigas for something other than playing SWOS once in
a while own either A1200's or A4000's (often upgraded).

>
> sticking with a 7MHz processor for over 5 years and all.. dont get me wrong i still >
love and have owned just about all of them at one time

> or another..

The really silly thing was that Escom re-released the A1200 without any proper modifications (except that disk drive, which turned out not to be compatible with all the existing games). They should have put in more memory, a faster processor and a HD. At least.

Pretty good. Visit this site:
http://amiga.emugaming.com/
(Amiga Interactive Guide)
It has loads of info about the Amiga platform, including the specs of all Amigas released.
Are there any similar sites about the Atari? It would be nice to see which Atari we should compare the A4000 with.

And no it's NOT Chaos Engine (as some replies have asked), it's a PD game by Martin Brownlow
based on Chaos which was released on the ZX Spectrum in 1985 on the Games Workshop label
and was written by Julian Gollop - the game is simple: 8 wizards battle each other until 1 stands,
it's pretty much the same as the Spectrum version except the Speccy version doesn't have all the
wacky sound samples found in the ST version. Martin Brownlow said I could distribute it if no
money was involved, so here ya go.... mail me and you shall have a copy - just don't ask if it is
any other game... :-)

I have _yet_ to see a site that correctly lists the specs of all
Atari products. The ST and Falcon are usually correctly detailed
but the Stacy, MEGA/STE, TT and clones are badly documented, most
of the time. My site provides documentation on those 3, but not
the clones.

: then it's a real Amiga. Glad that's settled! (Seriously.)

No, that's not true. The Kickstart is not a Macintosh boot ROM, but
anpother operating system, and the "Mac" runs as a task under a host OS.
Without the AmigaOS, you could never run MacOS on an Amiga.

: mislabel it as Mac OS.

What was the last "real" Mac, then? The Plus? The SE? The Classic?
for all intents and purposes, PowerMacOS is MacOS. It runs old binaries,
it runs older, recompiled programs, its API is identical, it runs the same
services. It just happens to run on another processor.

:> Or for that purpose, what do we make of my i386, Amiga 4000 and
:> DECstation, all running NetBSD?

: The hardware is what actually defines a computer platform, not the OS
: or applications that run on it. Take the PC - it's always a PC whether
: it has Messy-DOS, DR-DOS, Winslow, Linux, Unix, Quarterdeck, BeOS,
: Netware or something else on it. The Amiga is still an Amiga, whether
: you have Amiga OS, Linux, Unix, or another OS running on it.

In some cases, you can't separate the two. There is a real difference
between a PowerMac and an Amiga running Fusion or Shapeshifter. The
PowerMac was from the ground up built to run (Power)MacOS. The Amiga was
from the ground up built to run AmigaOS. The PowerMac would never have
been conceived if it wasn't to be a Max.

Hi Guillaume
In my opinion they are certainly worth having, they give the standard
Falcon keyboard the "feel" of the MSTE/TT keyboards. The standard one was
no good for typing long thesis on, far too rubbery - like the ZX Spectrum.

>BTW is there any other place than Best Electronics where I can get it for a

Not sure about that, I got mine from Best at an early AC show in
Birmingham. I did see them listed one time on the System Solutions
catalogue. No doubt someone will come up with a nearer supplier!?

Neil :-)

The NEC-25 has a DIP switch for termination. The problem is (at
least on mine) that the DIP switch DOESN'T WORK! A pass through
terminator (~$10) solved the problem nicely after many hours of
frustration.

4343. No metronome click in Cubase Audio Falcon?

Newsgroup: comp.sys.atari.st
Date: 2000-03-29 00:00:00 UTC
From: Russ Magee <rmagee@home.com>
Message-ID: <38E2973C.C55D3075@home.com>
Source record: 63589
Cross-posted to: comp.sys.atari.st,comp.music.midi

Hi all,

My former piano teacher picked up a Falcon 030 for cheap, with Cubase Audio Falcon (v1.01 and 2.02). When we originally tried the program out, the metronome would sound fine (through Falcon's internal speaker, the monochrome monitor, and as MIDI metronome to his keyboard).

That was around a year ago. He called me up last week saying that it has suddenly stopped doing any kind of metronome. I have verified that his Falcon's internal speaker, monitor sound out, and MIDI ports all work properly. (On the GEM desktop I can hear the key click sound just fine.)

I've verified the following:

- In Cubase's Options->Metronome... menu, 'beep' is enabled, on Pre-Roll and Record.
- The 'click' button in the lower right of the main Cubase window is enabled.
- Audio->Internal Speaker menu option is checked.
- The Falcon's sound (e.g., keyclicks) DOES work on the Desktop. It is muted as soon as Cubase starts, and remains off after Cubase exits.

Anybody still use Cubase Audio Falcon, and has seen this behaviour? It's pretty hard for him to do any sequencing if he can't hear the metronome. I must be missing some setting somewhere, but no other metronome controls are mentioned in the docs.

Thanks in advance,
-Russ

GEMDOS is initialised before even boot sector programs are started. The
AES and VDI, on the other hand, are initialised _after_ AUTO folder
*.prgs have been executed.

what about 1.1?? didnt some A1000's ship with that?? then maybe some A2000's shipped with 1.2 before shipping with 1.3 standard.. im pretty sure
that every A500 had 1.3 though..

> Well, I agree that they (at least the A1200) were too little too late,
> but still they were "neccesary". Thanks to these models, the Amiga
> extended it's commercial life a great deal. And, I think that most of us
> who still use our Amigas for something other than playing SWOS once in
> a while own either A1200's or A4000's (often upgraded).

its funny but the one thing i would have liked to have seen most on the A1200 was an internal power supply.. the Amiga never had a real portable
machine but if not for the ungainly external power supply the A1200 would have been like a sorta portable.. the A1200 is still my machine of
choice - and even though the 020 processor and no standard internal HD was pretty weak - its the A600 that was really too little (literally) and
too late and confused the whole market by continuing to support non-aga machines..

time to wax philosophical a bit..

you mention playing SWOS and someone else mentioned how the Amiga community's undying devotion to its roots and classic architecture is in fact
holding the machine back.. but i think i would like to say that the Amiga has no future.. while at the time (1985 - about 1994) the Amiga's
standard chipset and ROM based OS allowed it to produce a higher-end of software, it turned out that the PC's and to a lesser extent the Mac's
nostandard architecture proved more evolutionarily viable.. as technology increases at such a rapid rate including any kind of hard-wired
standard chipset can only hold you back - except in the case of the consoles.. but there is no room in that industry for an underdog new
competitor and there is no place in the Mac / PC world of computing for the same (just look at BeOS).. the Mac has assumed any niche left by the
Amiga and has done a far better job of adapting to the future.. at the time of the Amiga, PC's were running Dos and later Windows 3.1 but with
very limited support for third-party products (like sound and video cards) and what they had were pretty weak and overpriced.. the Amiga's strong
suit was always its multi-tasking multi-threading OS that had a tiny footprint on the system's resources - and its custom chipset, although some

of the chips (namely the graphics ones) reached their point of usefullness faster than others (hence the AGA).. this allowed Amiga products to
support a standard that was higher than anything on the PC and Mac native.. it was infact very much a console at heart.. it also had all the
interactivity of a full-blooded computer and the greatest community of talented coders on any machine, ever.. but once the technology began to
catch up, the Amiga's standard architecture became a bottleneck.. the PC's with their "plug-and-play" architecture and now instituted support for
third-party add-ons in the OS itself was actually superior.. the PC is less an actual machine as it is a concept - unfortunatly one running
Windows OS more or less.. the way anything on the machine can be swapped out and replaced - CPUs, Sound cards, Video cards.. whats the point of
having that on an Amiga?? it already exists on the PC and it has such a vast market share the only way for an Amiga variation to survive for any
time is to support fully Windows software by emulation.. thanks but ill just take the PC - god knows they're cheap enough.. machines like the
A500, A600 and A1200 are like fancy consoles (don't ask me what the CD32 or CDTV are - i'd say mistakes..) and with the strength of the console
world today compared to what it was the better part of a decade ago i'd say those types of machines have no place in this modern time.. as for
the A2000, A3000 and A4000 generic desktops - they would have to forego the custom chipset - but when you lose that you lose a large part of the
soul of the Amiga.. the OS would have to support Windows by emulation - not to mention that with 18.2 GB hardrives and CD and DVD drives standard
the world just has no place for the garage-coder - have you seen the credits for Photoshop or Director or even any CD-ROM game?? its like an army
of people.. the Amiga was always about small groups (and sometimes singularly exceptional individuals) of incredible talent working with some
degree of obsessiveness almost more to break new ground than to make a lot of money - just look at the Los Gatos team.. alright maybe thats a
little wishful thinking - but i know for sure that the coders on the Amiga were par none - and the demoscene coders even now today still
consistently amaze myself and my friends.. once all that is gone; the OS masquerades most of the time as a Windows emulator; the custom chipset
is replaced by a SoundBlaster and VooDoo - where's the Amiga?? so maybe my harboring on the Amiga's classic architecture isnt helping the machine
"retake" over the computing world, but lets face it: thats not going to happen and nor is there even a need - every time i hear about some new
owner and their strategy for the Amiga i just roll my eyes.. the PC's and Macs, Playstation's and Dreamcast's are doing a fine job and the
software available for them today is truly awe-inspiring.. so long as i can still pull out my Amiga and wow people with Super Stardust, a 4k demo
- or even better an AGA CNCD/Parallax one - impress them with my multitasking OS, and play some great MODs; i'll continue to keep it around..
luckily, as the more absurd the technology benchmarks increase - with CPU's climbing above 800MHz and all - im confident my Amiga will continue
to wow anyone that can understand how small 4k really is..

^^i'm just gonna post this without editing it or trying to make sense of it but id be curious to hear what you think.. :)

> The really silly thing was that Escom re-released the A1200 without any
> proper modifications (except that disk drive, which turned out not to
> be compatible with all the existing games). They should have put in more

A better bet is to grab Lacescan from the 'net. This piece of hardware fits
inside your ST (not STe), and lets your Atari actually use that black
border as additional screen space. A better bet than just expanding your
screen.

ooops. sounds like a termination problem.

1)check that your megafile30 is _not_ terminated. Only the *laST*
physical
device in the SCSI chain should be terminated.

2)check the manual of the NEC (sounds like a NEC-25) for how to
terminate it.
It sounds as if the CD-ROM is the last device in your SCSI chain, non?

3)run the ExtenDOS install program. search the SCSI chain and it should
find the CD-ROM.

good luck.bonne chance

without insulting you just like all computer stuff Monitors are falling in price, a 14" is 69ukp in my local PC world (with a three yr on site warranty) granted the Microvitec will sync down to ST med and low, on the other hand a modern monitor can achieve bigger Falcon extended rez's with the likes of videlity/nemisis without the risk of damage, if it ends up that you just want it out of the way very cheaply please mail me.

Russ,
This is not an answer to your question and I'm not an experienced Cubase
user (although I have it) but if it works like other sequencers and you can
hear the midi notes being played, a 'click track' for tempo set to a wood
block may be useful until the problem is solved.

According to the docs, when the mini icon is activated then the CAB Check module will compare the URL with the one that is in the cache, when it's deactivated then the CAB Check module will not check the URL.

<SNIP>
Vor diesen Sympolen befindet sich noch eine weitere Markierung, die per Mausklick ein/ausgeschaltet werden kann. Das Modul zur ï¿½berprï¿½fung der Hotlist wird nur solche Eintrï¿½ge ï¿½berprï¿½fen, bei denen diese Markierung eingeschaltet ist.

> [description of the amazing flexibilty of AGA and ECS video chipsets]
Wow, that *is* nice! :) But again both Amiga 1200 and Falcon suffered from
lack of a chunky (aka one byte per pixel) 256-colour mode IMHO...

> i mean horizontal shift by hardware. the 1200/4000 can scroll any resolution
> with just one register access. and the hardware isn't even bound to full
> pixels, you can also scroll by 0.25 pixel steps for VERY smooth scrolling.
Since the STe (TT included): pixel-accurate scrolling in planar modes.
Falcon 32k-colour mode: same (2 pixels steps in standard but can be set to
1 pixel mrather easily by other video hardware registers, perhaps even finer
scrolling can be achieved by similar tricks).
Well both needs at least two (2!) registers :)...

> the amiga has 2 scroll registers, one for the even and the other
> for the odd bitplanes. this way it's very easy to do parallaxing.
Gasp! That is *really* nice! :)

> there's even a special mode to use for parallaxing, the dual playfield
> mode. this mode is very similar to standard bitplanes, but the
> two parallax layer both get an independent palette, so for
> 8 planes you don't have a 256 color palette, but two 16 color
> palettes.
I do not see teh difference with the 1st one. Easier palette handling? Oh
yeah, perhaps you do not have to do silly color palette tricks to avoid
transparency (anti-glenz effect :)...) !

> vertical scrolling is ofcourse possible by changing the bitplane
> pointers, but this should be possible on atari too?
If no vertical parallax scrolling is involved: yes!

> well, c2p was a big problem back then when aga was young. nobody knew
> how to do it fast. nowadays the c2p-converters are that fast that it
> doesn't matter if it's chunky or bitplanes since the 16 bit chipram is
> that slow, that the c2p conversion runs completely in chipram waitstates.
Nice to know... should try these on Falcon! ;) A shame Chip-RAM only has
16-bit access on the Falcon :(...

> in clear words that means a complete 8 bitplanes c2p conversion is as
> fast as simple 8 bitplanes copy. (move.l move.l move.l ...)
Well, so there is always an overhead, though minimal!

> nope, all cycle list i checked stated muls with same speed on 020 and 030.
> besides, i never noticed a speed difference between these both processors
> myself.
I thought I saw some docs stating that... well... surely cosmic rays

affected my brain this time! :) Needs some parity-check...

> it's faster on 040 and ofcourse on 060 (2 cycles :)
sigh

If you want to use it on a Falcon, get Brainstorm JPEG Decoder on Pink
Pages: http://www.users.zetnet.co.uk/pinkpage/code/source/asm_lib.zip
Else you can use :
- Parx's JPEG module (part of M&E system, shareware) :
http://www.epita.fr/~da-cun_e/ME_GB.HTM
- Joint Photographic Expert Group's sources actually:
http://ftp.lip6.fr/pub9/atari/Graphics/Index:
[...]
jpeg5abn.zoo : JPEG SOFTWARE 5a Create and display JPEG files
jpeg5src.zip : Ind. JPEG Group's fifth P.D. release, sources
jpegv5b.zip : Ind. JPEG Group's fifth P.D. release, binaries
[JPEG RIM also here, see above...]
rimjpeg.zip : RIM JPEG pour le concept M&E de la societe PARX.

These ones must be old, but you could find new ones quite easily
```

Hello,

in article <38e12110$1_2@athena.netset.com> (comp.sys.atari.st)
Dan Ackerman wrote on Tue 28-03-2000 16:16 (-0500):

> Well I found the reason. Onelist is sending a cookie that expires
> in 1970. Probably just some trick to keep IE or Netscape from ever
> expiring the cookie.

This is a way - sending a cookie that expires in the past - to set a
cookie just for one session. It should be expired when the the browser
is terminated. But it seems Cab doesn't do it correctly with 1970-01-01,
from what I can see here. Maybe Cab "thinks" this date is in the future.

Bye,
/Pascal/

Other name for it is 'overscan'. That will not work with lot of
software...

You can adjust only very little in monitor. No chance to fill whole
screen.
However it's possible with adding couple capacitors at appropriate place.

: that every A500 had 1.3 though..

Yes, and there was even a 1.0. You can find a link to the "Workbench
nostalgia" page at http://www.canit.se/~glenn/
There were 1.2 A500s, too.

By chance, I found two such progs on old ST Format coverdisks. One is on
disk 13, and is called CLI, another on disk 2, called PCommand. STF
coverdisks can be downloaded from http://dewey.ecs.soton.ac.uk/stformat/

Andrew,

If you should need a new floppy drive, I have one NEW disk drive still in stock for the Atari system, complete with Atari's custom faceplate to make installation a simple swap if your system has the narrow style faceplate that Atari used during their last several years of production (grey faceplate with the rectangular shaped opening, not the trapezoidal shape). If you need the drive, its closeout priced at $29 plus $4.30 for Priority Mail shipping within the continental U.S. Email me at s.winick@worldnet.att.net if interested.

By the way, the drive is actually an Epson SMD-380 with the custom Atari faceplate, which is the DS/DD drive Atari used during the final few years of production.

Yes I have and yes there are. But it might be better to simply buy a
new drive.

> lack of a chunky (aka one byte per pixel) 256-colour mode IMHO...

yes, this would have saved a lot and especially for a1200 this would
have saved a lot of time. i mean, there was a delay of several years
until people were able to do 256 color chunky stuff in ok speed.

i can't tell for falcon though. i noticed a lot of gouraud and texture
mapping demos short after the machine came out so i suppose that it
was a bit better there.

> > i mean horizontal shift by hardware. the 1200/4000 can scroll any resolution

> Well both needs at least two (2!) registers :)...

uh? never noticed that the ste had some pixel shifting. was it removed
again in the falcon?

> > there's even a special mode to use for parallaxing, the dual playfield

> > palettes.

> I do not see teh difference with the 1st one. Easier palette handling? Oh
> yeah, perhaps you do not have to do silly color palette tricks to avoid
> transparency (anti-glenz effect :)...) !

you save some palette handling and on a500 you also had two 3 bpl
layers with both having an 8 color palette, while without dual playfield
you would need a 64 color palette, but the a500 only had a palette of
32 colors.

additionally, the palette of the sprites was also part of this 32 color
palette, so if you used all bitplanes for dual playfield you wouldn't
have independent colors for the sprites.

mostly used bobs (blitter objects) which were not limited to a small
number. but, if you need some graphical stuff independent from the

planes sprites were the choice. especially in demos they were used to
add design elements to effects which already completely used the planes
for themselves.

> > vertical scrolling is ofcourse possible by changing the bitplane
> > pointers, but this should be possible on atari too?

> If no vertical parallax scrolling is involved: yes!

yes, i remember these strange word-interleaved bitplanes. the first time
i ever checked out the MOVEP command :)

> > well, c2p was a big problem back then when aga was young. nobody knew

> > that slow, that the c2p conversion runs completely in chipram waitstates.

> Nice to know... should try these on Falcon! ;) A shame Chip-RAM only has
> 16-bit access on the Falcon :(...

same on a1200, chipram is slow as hell. you only needed to add some
fastmem and the machine was 4 times faster, without a faster cpu...

> > in clear words that means a complete 8 bitplanes c2p conversion is as
> > fast as simple 8 bitplanes copy. (move.l move.l move.l ...)

> Well, so there is always an overhead, though minimal!

no, the speed is exactly the same. (i assume that the source data is
in fastmem and the target is in chipmem, chipmem-only machines are
slow as hell and it's not very likely that you'll do chunky effects
on it :)

one thing i have forgotten to mention: mostly we use 2 different
types of c2ps: one type for 020/030 which does 3 merge passes with
the cpu and one with the processor, and one merge pass with the
blitter. for 040/060 based machines it's better to use a cpu-only
routine.

> > it's faster on 040 and ofcourse on 060 (2 cycles :)

> *sigh*

hehe, shall i mention the floating point cycles?

Graham.

> what about 1.1?? didnt some A1000's ship with that??

Yes, and they could of course be upgraded to 1.2 and 1.3 by
simply loading a different kickstart disk. There were even hacked
kickstart disks around that performed some special tasks, but I
have forgotten what their purpose was.

> then maybe some A2000's shipped with 1.2 before shipping with 1.3 standard.. im pretty

> that every A500 had 1.3 though..

You may be sure, but you are mistaken nevertheless. My first
Amiga was an A500 with Kick 1.2 and 1.3 didn't come out for *at
least* another year after I got it.

I don't know much about the Amiga myself, appart from that there are differences.

All I can say about them is it would depend what you wanted from a computerm, as to which one was best for what you wanted it to do.

You also need SCC.PRG as part of the HSMODEM6 set, after DRVIN.
SETTER you can put elsewhere (eg another drive under Utilities).

Forget GDOS, get hold of NVDI (5.xx) and, indeed, WDIALOG.PRG Last in
your AUTO folder).

All the best,
Charles.

> >.
>Hi Russ

I am a Cubase user, but not CAF. I use Cubase on a TT030.
Try this:

Go to OPTION/Metronome Check that MIDIclick is enabled. Set your High and Low notes that correspond to different drum sounds.You have to experiment with this for a pleasing combination. Channel=10 (that is if he is using a GM module). OUTPUT= Atari.

This will enable at least a click thru midi. Here might be an obvious answer to the Click from the speaker. Try going into the CONTROL .ACC and adjusting the sound output from there.(that is if you are using CPX modules)

Hope this helps. Come join us at the Atari-midi mailing list if you want. We are having fun there. Might be some CAF users there as well. See sig

Sadly all that was said by -kK rings true. I hate to admit it myself.
The death of the MCC was the final nail in the long prepared coffin of
the Amiga - I really hate saying this.
Its best just to appreciate the Amiga for what it was and is: as the
last of the great home computers. Hell I know my Amiga is finite, even
I one day will have to buy a PC just so I can preserve it in emulation
(most likely on a single DVD) as much as I think PC's suck - or at
least they do with any Microsoft product on them.
It is sad that we have ended up with the monotanous dominance of
Wintel today but so long as Linux or the Mac is about there will
always be an alternative. Commodore were always a right bunch of
idiots and frankly kicked the gift horse in the mouth with their
handling of the Amiga. They never deserved it in the first place. One
can only imagine if somebody with a brain had managed the Amiga.

Eh? That's what should happen. There IS no separate CD-ROM
screen.

Try this...

Unplug the hard drive and plug the CDROM directly to the CPU.

Boot the computer with Extendos in the Auto folder of a floppy.

Once you get to the desktop, create a drive icon that has the
correct drive letter for your CDROM (it's probably P:, unless
you changed it).

Double click on Drive P. You should see your CDROM, assuming
it's an ISO9660 CD.

Tell me what happens.

4395. Web Browser and multitasking dilemma

Newsgroup: comp.sys.atari.st
Date: 2000-03-30 00:00:00 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <38e434ba$0$40288@news.execpc.com>
Source record: 63641

Greetings,

I have been looking for a web browser for my Atari system.
(Falcon 030 4 meg)

I would like to be able to see graphics, but after reading
several Atari links it seems that you only see text only.
Is this true?

I started to set up StinG and CAB (v1.5 - I think)
In order to read the .HYP files I "attempted" to set up
ST-Guide.
I thought I installed it on a "clean" system, but it really
messed up my system. My screen resolution changed.
Everything was large print. It took me days to sort it all out.
I was so fortunate that I backed up prior to doing this.

Then I thought about The Draconis web package.
I think an installation program comes with it.

But if its true that you can't see graphics, what's the sense?
I may as well just stay with my shell program.
There's a menu, I can access ftp, telnet, etc.
Though for some reason, I can't seem to do anything with Apache
servers. I tried to visit B&C. Couldn't go anywhere.

November '98 issue of Electronic Musician has a very interesting
article about Linux. (page 36, Linux means freedom for computer
musicians)
They refer to a web site. http://www.linux.org
Here it says that you can use Linux/m68K on an Atari.
I think you need a math co-processing chip though.
Then they talk about Linux programs http://www.opensource.org
It seems like it would be good for multitasking and the internet, But I
doubt if I could run any TOS based programs.
Besides, it seems terribly complicated to set up. Not to mention
the memory it takes. And up-to-date programs out-of-date docs.

Any suggestions for this dilemma?

ken

Hi,

Just thought I'd mention something about FOLDR200.PRG

I run a Falcon 030, so I am not sure this applies.
In my manual B-12 Advanced Hard Disk Utilites:
Extending the System-wide Folder Limit

Acutally I think its called FOLDR100.PRG
"To use this program, display the AUTO folder directory on drive C
containing the FOLDR100.PRG file. Then change the 100 in the filename to
any value between 001 and 999 using the Show Info option from the File
menu. The value you enter is the number of folders beyond 40 you can
now access. For example, to extend the limit to 240 folders, you would
change the filename to FOLDR240.PRG."

...each folder uses 132 bytes of RAM

Why use precious RAM if you don't have to?
Then again, this depends on how your system is set up.

Hope it goes well.

Yup. PPP needs one of three login options, determined by your ISP:

1) Standard scripted login - supported by everything (except STiK which
doesn't do PPP anyway in the released versions, only SLIP).
2) PAP, which allows unscripted logins - supported by STinG, MiNTnet,
Iconnect. Dunno about Draconis/Wensuite.
2) CHAP, which allows unscripted logins with the password etc encrypted
rather than sent plain - supported by MiNTnet, I believe.

In article <$woIxXAseo44Ewd5@my-ste.demon.co.uk>,
David Bolt <nospam@my-ste.demon.co.uk> writes:
> GEMDOS is initialised before even boot sector programs are started. The
> AES and VDI, on the other hand, are initialised _after_ AUTO folder
> *.prgs have been executed.

Almost right ;) Only the AES isn't available inside the AUTO folder;
it's perfectly possible to open and use a _physical_ VDI workstation -
that's how most GUI-bootselectors work.

Ciao

you used the dip switch to set the SCSI id, what about termination?

is your hard disk terminated? if so, remove termination.

this brings up a query i had about megafiles.
the atari manual does not even mention termination. it says just daisy
chain the drives together and it will all work.
huh?
were the atari acsi-mfm/rll adaptors automatically terminating?

Hi group,

does anyone know if author of ghostlink ever released version which
would work through paraller port?

He mentions it in documentation but i've never found version supporting
this..

Or do you know if there are sources available somewhere, i think i could
be able to do paraller modification to code by myself..

-c.backroos

ps: i'm quite happy now since just yesterday i got 1040Ste for my self
with 4megs of ram. nice improvement from 520Stfm with 512kb of mem. =)

Terry,
My concern is ANY entity (not just Pay Pal) having full access to BOTH
my credit card AND bank account! I realize there are other options. One of
which you are signed up for which is good to know. The other point
you brought out was $0 instead of $50.00 for owner liability. I don't need
to debate that! As you've stated, all need to know info about
Pay Pal. I agree! But if you want to haggle over side issues, I'll gladly
discuss them with you by E-mail so we don't have a John/Terry thread that
goes on and on. That, this NG does'nt need!

> A2000's shipped with 1.2 before shipping with 1.3 standard.. im pretty
> sure that every A500 had 1.3 though..

Except mine then. :) ...My first Amiga: A Kick 1.2 A500. (Beautiful wee machine. ...Outlived my a1200 even.) ...Think I'll have to boot it up today and play Ghosts and Goblins - which hates my A1200 and A4000.

Never found any 1.3 software that didn't like 1.2, so I never bothered to upgrade the Kickstart chip.

> its funny but the one thing i would have liked to have seen most on the
> A1200 was an internal power supply.. the Amiga never had a real portable
> machine but if not for the ungainly external power supply the A1200
> would have been like a sorta portable..

Well, it's not terribly bad IMHO. I've got a shoulder bag which is just big enough to fit the a1200, power supply, a hard-cover book (mouse mat) :) , a/v cable, mouse and joystick. ...Even a box of floppy disks if needed.

I'm kinda glad the Power Supply isn't internal. They generate a lot of heat, were a little underpowered, and kinda weighty. (And commodores ones were crap.) :) ...I bought a third-party, switchmode, power supply and it's just the greatest thing. (One tenth the weight of the transformer type one that commodore did. ...I understand they did switchmode ones initially, but went to simple transformer ones when they gave problems.)

> the A1200 is still my machine of choice - and even though the 020
> processor and no standard internal HD was pretty weak -

With an 030 accellerator and FastRAM (and a decent size Hard Drive) the A1200 is a nice beast. ...It's great for a semi-portable thing to be connected to a big TV and play multiplayer games on. For more serious stuff, the a4000 is my choice tho. (I only really use the a1200 for link-up games or when I'm stuck at someone elses place and need to bring a computer.)

> its the A600 that was really too little (literally) and too late and
> confused the whole market by continuing to support non-aga machines..

Yup. ...One thing that most annoyed me was the release of the a600.
(Had no real benefits, apart from the smaller physical size, over the
a500. ...And why re-release the a500 anyway? I was old technology.)

...Nowdays tho, it would be nice to have an a500 compatible (ie: real
68000) machine to go with my a1200 and a4000, but doesn't take up the
room of my a500. So I might pick up a second hand a600.

> time to wax philosophical a bit..
[*BIG* SNIP]
> ^^i'm just gonna post this without editing it or trying to make sense of
> it but id be curious to hear what you think.. :)

A very interesting read dude! ...Always good to read another Amigan's
perspective.

Myself, I think I am at that stage where I just might buy a PeeCee. But
I'm sure as hell going to keep my Amiga too. It's a beautiful machine.
And windows can just piss me off sometimes. (Well, a lot of the time.)
It's just unnecessarily bloated and full of crap for most of what I want
to do. ...Cheap CPU and GFX power would be nice though.

I'd love to turn my A4000 into the most kick-ass Amiga in New Zealand,
but I just don't have the money for that. :/ Maybe a cheap GFX card and
CPU for now. (A 25MHz 030 does suck when you want CPU power.) :)

> i wasnt even aware that Escom released anything for the Amiga.. thats
> how out of the scene i have been these past 4 years..

Well, they did. But it's never been anything new, or particularly
interesting. The BoXer seems to be the only vaguely interesting thing
in the near future. (A PPC only card would be nice too. ...Some money
for them all would be nicer.) :)

Ken,
You should certainly see graphics such as JPEGs and animated Gif's!
Is your version of CAB set for TEXT ONLY? That could be why!
If so, just un-X that box. I'll leave your other questions to someone
more knowledgeable.
John G.

> That ought to end the argument about whether the next Amiga
> will be a "real" Amiga. If it runs old Amiga stuff in emulation,
> then it's a real Amiga. Glad that's settled! (Seriously.)

Fine, take a paragraph out of context and misinterpret my comments
as much as you like. :)

I was just trying to point out how it's not such a simple distinction
between the a Mac and a 'non-Mac' (by his definition.)

If you can use the exact same hardware and software on a PPC Mac, and
the support for that hardware and software still comes from the same
people, what's the point of claiming it's not a real mac? Technically
he may be right - but his point is of no practical use.

More useless points to ponder:
Did the Quadra suddenly become a non-Mac when the PPC board was put
in it? (MacOS did not have to be reloaded ...everything still worked.)

Does an A1200 suddenly not become an Amiga when an 060 is put in it?
(Some of the 020 instructions are not present on the 060, and are
emulated in software.)

Does it not become an Amiga when an 060/PPC board is put in it? (The
PPC is only a co-processor after all. ...Would you consider the PPC
apps to be non-Amiga then?)

Or will it only become an Amiga if/when a PPC only card becomes
available, and the 68k is 100% run in software.

Will a playstation 2 not be a real playstation? The CPU of the
playstation is actually present on a playstation 2. In PSX2 mode
it's a simple IO processor, but in PSX1 mode, it functions as a
real CPU.

Was the c128 not a real c64 when running in c64 mode? The processor
may have been of the same family as what was in the c64, but it was
the other processor (Z80) which the primary processor on bootup, and
relinquishes (<---Spelled right?) :) control to the 6510 for c64 mode.
...And was it a true CP/M machine? It did use the 6510 for its I/O
after all.

Personally I think the whole issue is silly and trivial, and the
rules aren't as simple (to any practical point) as the previous
poster claimed. ...and will probably become less-simple as the

hardware continues to develop.

Nathan.

CAB shows graphics just fine. Version 2.8 even shows PNG.

However, I strongly recommend adding more memory to your Falcon,
if you intend upon running a multi-tasking environment. 4 MB is
just _way_ too small for this.

From: fourje <fourje@netscapeonline.co.uk>
Message-ID: <38E51916.B2431466@netscapeonline.co.uk>
Source record: 63507

Well, after many years, I've finally been given an old 520 ST. Afraid it was stuck in an outside shed for years, In fact, all of the software discs were thrown away the week before I asked for the 520. I think I may have some cables with it - no diskettes - don't even know what size floppy it uses. Need to be able to connect to a TV - monochrome WP only.
Question - is it worth spending too much time on this, or should I just try and buy one from a thrift store or somewhere.
Thanks in Advance.

>800KB is no problem

And even more than 900KB if you are very crazy. Depending on the brand of
floppy drive... A couple of years ago, after much hesitation, I decided
to try these "high" formats on a Mega with Epson DD drive. It turned out
that I could format floppies up to 84 tracks x 11 sectors = 924KB!
I used good quality floppies and kept the computer and the drive reasonably
clean, and I had absolutely no problem with long-term reliability of data
on floppies formated that way.

Then I upgraded to a HD floppy drive (Teac), and a little problem appeared
concerning reading of 84x11 floppies- as the HD drive could not manage
more than 83 tracks. After a little persuasion with a scalpel, it manages
84 tracks all right (had to reduce head-travel limiters for just a
fraction of a millimetre).

From: atarist@xs4all.nl
Message-ID: <8c2qrh$cv5$1@news1.xs4all.nl>
Source record: 63510

Yes never trust a switch or jumper telling you that it is for
termination on/off.

I have a Epson GT-9000 scanner with such a switch.It is on the end of
the bus. But termination on gives for LOOK II a 'not found'.
Switch off and external terminator in the out-plug works!

The same happens with a ZIP drive. The modern ones should find out
themselves if termination is needed. That they do not right in my
case. So I use a external terminator (again).

To ALL,
My apologies to all in this NG for going on with this "debate"! I'd rather
have had this 'off-topic' scenario privately by E-mail but.....

Terry,
I think you're working your way around to saying the same thing I've been
getting at all along!

My concern is NOT with PAY PAL, "forgery" or fraudulent use here but
"glitches" which can possibly be compounded when more than one account
(bank/credit card) can be accessed by the SAME company! ANY company!!!

Ex: Almost worse case scenario:
You give authorization to a company to automatically transfer funds from
your bank account to your company account! ACCIDENTLY the transaction goes
through twice (a reputable company charged my card FOUR times once for the

SAME order!). There's not enough in your bank account to cover the charges. Automatically, funds from your credit card are accessed to cover the second charge (hopefully this does'nt put your card over-limit). Now you have the credit department at the bank (where your card is at), customer sevice (for your bank account) and the company doing the transactions envolved in figuring out what happened!!! All will PROBABLY be straightened out but how long will it take? It can and HAS happened numerous times to many!
Terry, if you feel the need to rebut this, PLEASE continue by E-MAIL!!!
John G.

the A600 was the counterpart to the A3000 (A600 : A3000 :: A500 : A2000 :: A1200 : A4000 - i think thats how the math goes :) its benefits were the ECS chipset, WB 2.0 and i believe a marginally faster processor (68010).. but yes, since it was released practically with the A1200 as i remember, anything not AGA at that point was old tech..

> ...Nowdays tho, it would be nice to have an a500 compatible (ie: real

> room of my a500. So I might pick up a second hand a600.

im not actually sure if its 100% A500 compatible what with the different processor and ROM..

> Myself, I think I am at that stage where I just might buy a PeeCee. But
> I'm sure as hell going to keep my Amiga too. It's a beautiful machine.
> And windows can just piss me off sometimes. (Well, a lot of the time.)
> It's just unnecessarily bloated and full of crap for most of what I want
> to do. ...Cheap CPU and GFX power would be nice though.

as the same time though there are a lot of refinements in Windows 98 and Mac OS 8 & 9 that make them nice to use - the Amiga's engine at its core is by far the best of any OS ive ever worked with - but it just wasnt around long enough to generate all the eyecandy and slickness of the other OS's - although there are some shareware apps to tweak the desktop, that's true..

anyway,

y'r pal -kK

There is an irritating bug in TOS in that the system does not
always clear the folder info when you leave a folder.
Eventually, the stack allocated to keep track of folders
overflows and the computer crashes. By running FOLDR200 (or
marking the correct box with ICD utilities), you can make that
stack several hundred folders in size. If the setting exceeds
the number of folders on your hard drive, the bug is gone. Even
if that is not the case, you make the bug much less noticable.

I have 256 extra folders, and turning off the Falcon every few
days means I never encounter the stack overflow. In fact, I've
been wondering if perhaps the bug wasn't fixed in TOS 4. I
don't know, but with 14Mb, I've got bytes to spare.

Hi Y'all

What about that dude who threatened to sue Demon cos he was slagged off.

I dont want to use his real name so i'l call him 'Sinclap'

We'd beter be carefull about calling 'Sinclap' a limp d&*ked low life
arse*ole with the brains of a oxygen starved tadpole or he could sue.

Source record: 63447

Dear All,

Just to let you know that the NeST network is up and running again. The BBS's involved are Athena BBS 90:102/140 (New Number to last nodelist 01784459922), Keiths Point BBS (01332662988) 90:107/200 and Andromeda Galaxy 90:102/101 (01489 690786).

If there are any other Atari BBS's out there that would like to get a NeST feed again please email me or crash mail me at the BBS.
Regarding International Mail feeds, if you guys are out there please get in contact with me. I have only managed to contact Germany and Sweden so far and am able to gate packets over the Internet to you.

If anyone has any comments please contact me.

Web2Mail

If anyone is interested in the Web2Mail project please let me know. Web2Mail gates FTN style mail to a web page interface. Just like Hotmail provides a web front end to your email. Web2Mail does this for FTN mail.

Take a look at http://www.athenabbs.demon.co.uk/web2mail

Regards

Rory

4435. FS Atari Stock 14meg Memory for Falcon

Newsgroup: comp.sys.atari.st
Date: 2000-04-01 00:00:00 UTC
From: "Brian J. Roland" <bjr@localink4.com>
Message-ID: <seck0moa9131@corp.supernews.com>
Source record: 63449

I have here an Atari Stock 14meg RAM board. Replaced it with newer faster
RAM
to support CT2. Now if I can just find a working Falcon to replace my dead
one!

It's not doing anyone any good sitting on the shelf...so if you want it make
any offer that covers shipping and my bother to pack it up and send it off.
First come first serve...

Brian

4436. bigger case for a Falcon 030

If it's the spin speed (as mine was) then you've no option but to replace
which I did with the 1.44HD version.

I have a progeram somewhere that will check the speed of the drive, if you
need it let me know and I'll dig it out.

Why is it preferable to use SCC? What does it actually do that MFP
doesn't?

I've been using MFP since I started and never realised that perhaps I
should change it when I upgraded, everything seems to work OK though.

I think they are far to different, you cannot just connect them.

Also the Atari is not "hot swapable" so if you attempt it, make sure
the Atari is powered down. :-)

> An interesting read :)
> I disagree with a few points, though.
> I have come to accept that the Amiga classic is, well, not in a good shape at all. It's not dead, but it's in a whole lot of trouble.

i believe that when they stop making new software for a platform its dead - so yes, one could argue that that's not the case with the Amiga - and it has
made it to the internet - but ... if its not there now its coming..

> But that is not to say that there isn't room for a new alternative.
> What we have today isn't doing a fine job. We have what? User unfriendly PC's? Weird Macs?

why are the Mac's weird?? they are only weird because the Amiga is not around to compare it to.. Mac's are the PC alternative - its like music that
way.. this is an Amiga (and Atari) newgroup so i don't want to start praising the virtues of platforms no one cares about, but in my work in new media
design i use PC's and Mac's everyday - and sure, both OS's are bloated and slow and tempermental but being as hardware is dirt cheap i get by - and the
software certainly makes up for the chore of using the OS..

> To sum it up: I think the world need a new computing platform. I know I need one (desperately!). It might be a next-generation Amiga, or it might be
> something completely different. What I feel is important is that it incorporates the ideas that made (and still make) the Amiga so great. The folks
> who designed AmigaOS got it right. So, for me, it doesn't matter if the new Amigas are "real" Amigas or not (it would certainly be a very bad idea to
> base them on the 68k line of processors), all that matters is that they work, in some way, like the current Amigas do.

well, both PC and Mac's OS are based on shoddy models almost a decade old (older for the Mac's) - maybe OS X and whatever the next-generation thing is
for the PC will be like a new platform - all we can hope is that they've learned a few things from the Amiga and are not to proud to use them..

right??

Your 520St has TOS / GEM on ROM unless it is one of a few early ones that used a TOS boot disk. To test this: turn on the ST and see if a GEM display appears within ~ 30sec.
Keep the 520St no matter what. You will probably want to get another ST, but it all depends on what you want to do. Many of us long term Atari users have many sytems (I have 22 complete Atari systems). If you just want to play games get a 1040STf; it has 1meg memoy and a built in 720k floppy. If you want a computer for every day household use, get a TT 030. It is fast, can have a lot of memory, has up to 4 serial ports, built in SCSI HD, VGA, and backwards compatible with the ST. If you are very serious about using an Atari for everything, get a Falcon 030 and either an Afterburner or CenTurbo 2 accelerator + put it in a PC case to hold all your peripherals (Of course, Atari clones are always a choice, but they are not "real" Atari). The only problem with the Falcon set-up is that it is not truely backwards compatible with the ST.
My main computers are a Falcon with CT2 for everything except games and a standard 1040ST for gaming with an external SCSI HD and of course a LOW res color monitor. My other Atari's are used for hobby stuff like networking, hardware mods, etc. I also have a small MIDI setup utilizing a MegaSte and another Falcon 030. I use one of my TT 030's as a file server and network router.

It seems as if you are into Unix/Linux OS on the PC. I have just started to experiment with Linux and freeBSD on my PC [I only have one of these %)] Soon I am going to try and use the Linux PC as my modem server and file server, but I havent gotten into it that much yet. Maybe you have some experince in this area?

Good luck and welcome to AtariMania!

Ah, thanks for reminding me of the real name of the processor. (I
couldn't be bothered finding my c128 reference guide just for that.)

Don't get me wrong (and I half-expected this example to cause controversy)
:) but, at the hardware-level at least, when the c128 starts up it is the
z80 processor which is first in control. This isn't at all detectable at
the software level since it gives control over to the 8510 immediately if
no CP/M boot device is detected, or if the commodore key is held down.

But this, technically, makes the z80 the primary processor. (Just trying
to illustrate a pointless example of obsessing about what the CPU is at
hardware level.)

A lot of lurking in comp.sys.cbm, and owning a c128 for many years can
teach one many inanely trivial facts such as this. :) ...Though it's
much more interesting to lurk in comp.sys.sinclair and learn inane
trivial stuff that has no relevance *and* is off-topic. :)

Nathan.

Terry,
It's a matter of keeping things in context and makes more sense to be able
to view what the whole thought was (without having to download other posts
until you get to the right one). It was'nt pages and pages to omit! Just a
paragraph as your's is above. Why not keep intact instead of picking apart
what you think are the faults? For me, it gives a better, overall look at
it instead of a response to something that may or may not be out of context!
It can give a totally different meaning to what's being stated which I
feel you've been missing in your responses!
John G.

Source record: 63536

Mind you, that also applies to a variety of LocalTalk products.

For instance, some years ago, someone on the STiK development list pointed out that LocalTalk to Ethernet adapters sold for very cheap, so I contacted several manufacturers (Fallaron, etc.) and asked if it would be possible to have either driver sources or API docs to write drivers from a non-Mac OS. "We haven't sold any of those in ages and either ways, we are not considering revealing any of our development specs to any third-party."

Same answer for their previous SCSI-Ethernet adapters.

(both LocalTalk and SCSI adapters were quite popular on m68k Macs, because they did not come with a built-in Ethernet port)

For VME products, people are slightly more open (e.g. some of the companies have programming API documents they openly share with their multibillionaire customers, pending an NDA signature) but even their standard catalog items are overpriced. For instance, I tried contacting BWVM to get them to produce another run of their VME Ethernet card. Well, even their bog standard card would have sold for twice the price of an already expansive Riebl VME card from Best Electronics.

To answer another question in this thread, the reason why some of those cards are supported by NetBSD is that certain VME computer systems (e.g. m68k-based SUN) are now considered obsolete by the industry and being dumped for very cheap by second-hand retailers or educational institutions, so people canibalize the cards from the complete systems and stuff them in their TT running NetBSD.

I forgot to mention, MiNT was once ported to those m68k VME CPU
cards up to kernel 1.12.4 release:

> ^^i'm just gonna post this without editing it or trying to make sense of it but id be curious to hear what you think.. :)

An interesting read :)
I disagree with a few points, though.
I have come to accept that the Amiga classic is, well, not in a good shape at all. It's not dead, but it's in a whole lot of trouble. And I have to
admit that I can't imagine that it will ever get into the position it once had. But that is not to say that there isn't room for a new alternative.
What we have today isn't doing a fine job. We have what? User unfriendly PC's? Weird Macs? That the PC is user unfriendly isn't just a myth. I
experience it every day with the Windows shitheap I'm typing this on. Chances are I have to restart it to connect to the internet (and it probably
won't work then either, because some crap part of the crap operating system performed an "illegal operation" when I disconnected from the net - it is
about time to reformat C: now). I experience this when our neighbors new PC decline to work the way it should, and they send it over here so that I
can have a look at it. The PC wasn't made for normal people. I've no idea who it was made for, but it sure wasn't made for me. A while ago, it was
popular to compare Amigas to various car models. Well, if the Windows based PC was a car, it would have never been allowed to set it's stinking
wheels on the road. (Ok, you probably sense some aggression towards the PC here.... sorry

about that. It's got nothing to do with me being an Amigan,
though. Well, perhaps. Perhaps my judgement of the PC reflects the fact that, unlike
millions of Windows owners, I know that computers could have
been so much better today than what they are if the world had been fair. This knowledge
certainly don't make putting up with this infernal machine
any easier).

To sum it up: I think the world need a new computing platform. I know I need one
(desperately!). It might be a next-generation Amiga, or it might be
something completely different. What I feel is important is that it incorporates the ideas
that made (and still make) the Amiga so great. The folks
who designed AmigaOS got it right. So, for me, it doesn't matter if the new Amigas are
"real" Amigas or not (it would certainly be a very bad idea to
base them on the 68k line of processors), all that matters is that they work, in some way,
like the current Amigas do.

Ok. Like you, I'm just going to post this without editing it or anything. I have a feeling
I'll regret doing so, however :)

hardware looked cute and full-featured, which was nice.

What didn't cut it was MacOS. When I told the salesman that last
time I had touched a Mac was in 85 he said "Go ahead, it looks
and feels the same as the good ol' Classic, only better."

That was just the problem: OS 9 is only a technicolor version of
the original MacOS. However, the various screenshots of Aqua (OS
X) on the web are reviving my interrest again.

The _only_ thing that doesn't cut it is Apple's "same hardware as
on a PC for twice the price" policy. I really don't care if they
managed to produce "the first Mac under $1000" if that amount is
still twice the competition's price.

he couldn't get very far, though, since it would be too easy to prove
that it's true :) Just insist on having a computer linked to a hispeed
access in the courtroom, access DejaNews and pull up all of his
braindead invective. Why, when the judge and jury sees the spelling
mistakes, the shrieking, and his insistence that there are "Atari
Jihads" who are "out to get him" and that his imaginary friend "Chunks"
exists, they'd have no choice to not only throw the case out, but insist
he immediately go to the local animal shelter to have his distemper
shots :)

Besides, Sinclap's filing a lawsuit would mean having to actually
appear in court. Which would also mean his actually filing proof that he
actually is employed as an "Apple Power Rep"....

4475. hard drive troubles with protar adapter

Newsgroup: comp.sys.atari.st
Date: 2000-04-02 00:00:00 UTC
From: phil <phil.w@btinternet.com>
Message-ID: <38E7805C.B7010CB6@btinternet.com>
Source record: 63471

hi,

I'm having immense problems trying to get my atari to use any hard drives bigger that 50 megs, my current setup is:

STe
Protar scsi adapter
Seagate ST 125N (49megs)
HD Driver 7.71

at the moment this works fine, the problems only arise when i try to add another drive. for example today I have been trying to get it to use a Quantum Prodrive LPS 240 (an IBM drive apparently). The drive works fine in my windows machine at home and at work, so I'm confident its not a drive fault.
What happens is, I plug the quantum drive into the scsi chain and power up the atari, HDDriver has a look and finds both drives, giving the id's on screen - so good so far, But when I run HDDUTIL and select Format or Partition, it only lists the Seagate - Ack!
If I then do an ID Check, both drives are again listed ok with their respective SCSI id's.

why-oh-why-oh-why doesn't it work? I've been trying to get various drives to work with this adapter for ages. Initially I thought it may have an upper limit of 500Megs as none of my 1 gig 2 gig drives would work either, but now that drives as small as 240 meg aren't recognised I'm getting confused.

I have managed to use two drives with the adapter, the other being a Teac SD-340 - another 40Meg drive, but ideally i'd like a bit more storage space.

So, can anyone tell me:

any information about the adapter i have - it says Protar HYBRID - und SMD -Technik on the board

why HDdriver can see the second drive but not partition it.

sorry for the long winded message, but this is driving me mad :)

cheers, Phil.

>which I did with the 1.44HD version.

It's just as likely to be a read/write head either worn down or knocked out of position - I've had that happen on at least 3 disk drives. I do have a head cleaner but use it sparingly - don't know if it's still available, but if it is it's worth a try before spending £12 or so for a replacement drive (that's what they sell for at computer fairs etc).

Do you have the relevant device ID switched on in HDD's setup. If his names
not down he's not coming in.

yeah - of course i remember the same thing with my Amiga - it was a different story when the Mac clones were around, but with Apple back at the helm its just not possible to buy a bare-bones Mac and configure it yourself for real cheap.. but the Mac hardware is no doubt superior to the PC's - not twice the price superior - but luxury items are never priced according to worth, its an image thing..

well, being as there are more PCs and Macs in homes now then there ever
were Amiga's (or Atari's) i can't really agree with that..

> Hell I know my Amiga is finite, even
> I one day will have to buy a PC just so I can preserve it in emulation
> (most likely on a single DVD)

i don't know.. i think keeping around your actual Amiga is a lot more
impressive than running just the software in emulation - i mean how
impressive is a game or demo or mod going to be when its running on an
800 MHz machine.. your Amiga however will be a tangible relic from when
computers first started to come into their own - and get fun.. and i
would guess that in the same way very large numbers (800 MHz, 256 MB RAM,
18.2 GB HD ...) impress us today, very small numbers (14 MHz, 2 MB RAM,
4K INTRO ...) might impress us tomorrow..

> It is sad that we have ended up with the monotanous dominance of

> always be an alternative. Commodore were always a right bunch of
> idiots and frankly kicked the gift horse in the mouth with their
> handling of the Amiga. They never deserved it in the first place. One
> can only imagine if somebody with a brain had managed the Amiga.

true about them not deserving it.. but a lot of what i was trying to say
(albeit rather badly) was that there is no place in the modern world of
computing for what you call "the great home computers" - unless maybe as
stand-alone internet boxes, which seem like the closest thing to a
computer-console that's not a Playstation.. yes, Commodore did sell us
out - but maybe in their own way they quickened the blow.. the Amiga
could be like one of those stars who died too young - like Bruce Lee or..
um.. Brandon ..uh.. Lee - it may have gone before its time, but the
legend will live on..

fighting off Wintel drunkin monkey style,

> about time to reformat C: now).

I own a PC and have done for 4 months, it only crashed on me once and that was easily recovered from. It really
depends on how well you look after it, I`ve had no trouble with mine (my Amiga crashed more often than my PC!)
maybe you need to check your software you have loaded and remove any crap. Its usually poor 3rd party stuff
that can cause problems than Windows itself.

> who designed AmigaOS got it right. So, for me, it doesn't matter if the new Amigas are "real" Amigas or not (it would certainly be a very bad idea to
> base them on the 68k line of processors), all that matters is that they work, in some way, like the current Amigas do.

The 68k line is dying off, you cannot even get them any more and Coldfire is incompatible (too cut down), the PPC is
one way to go and include some sort of emulation. Amiga/Tao seem to be heading the right direction - see latest news
from Amiga2000 show this weekend for details!

: well, being as there are more PCs and Macs in homes now then there ever
: were Amiga's (or Atari's) i can't really agree with that..

A computer in the home is not the same thing as a home computer. My
neighbours had a '286 once upon a time. That's no home computer. The
Pentium sitting in many homes nowadays is rather a family computer.
Its applications are wholly different. The common home PC runs Office and
Quake. It is used and bought by the man in the house, not by the son in
the house. There's a big difference.

It drives the SCC chip. If you have only MFP, SCC is rather
useless and vice-versa. A few computers have both.

Your post hints at termination problems. If both drives are
external (I'm guessing), kindly plug a terminator into the
second SCSI port of the second drive.

For what it's worth, drives will be recognized under quite
interesting circumstances, so the only thing you've thus learned
is that the ID numbers are O.K..

Hello,
I was introduced to Atari computers in the late 80's.
I worked for a now defunct music publisher.
They had a music typography program designed by a physicist from
Germany.
7 atari stations linked to a UNIX mainframe.
In those days it was a 1040stf TOS 1.00 1 meg and 20 meg hard drive.
The main frame took care of the rest. Speed and memory.
The program was a marvel.

Now I use a Falcon for personal use. I am trying to learn Logic 2.5
But I don't have a whole lot of time to work with it.

> > >Just thought I'd mention something about FOLDR200.PRG

I am using AHDI, so I guess I will need it. Thanks for the tip, 'cause
I am not using it right now. I was looking for the Falcon version
a while back but could not seem to find it.

Thanks again

If you invoke the Hotlist check module whilst online CAB will scuttle of
and compare its cache with whats currently online and report if anything
has changed since your cached version was downloaded, and will mark the
hotlist accordingly. If youve got the icon concerned switched on the
relevant entry is checked, otherwise its not checked.

You want to make copies of data file cassettes? Play on one and record on the other. (which is how I used to make copies of Zaxxon 15 years ago, their ridiculous copy protection only made loading the game harder to do). The cassettes are audio. You might want to clean the heads on the cassette players, it don't take much to screw up the recordings.

Well, that was one of the (very few) "e"nhancements...

> again in the falcon?
It has remained exactly the same on the Falcon in planar modes. In
65k-color as I said before, you can only have longword-aligned video base
addresses, hence the limitation to 2-pixel-accurate scrolling.

Actually, most PGS printer drivers will already do this, but it is an
undocumented feature. Go to the "Global/Configure Printer" dialog
and type "a4" in the Special field. You might also want to increase
the paper size in this dialog, since the printer drivers get their
info from here, NOT from the document layout.

To find out which paper sizes are supported (and the exact spelling
of the keywords), search the data section of printer driver (I find
the editor in Flash 2 good for this). Or you can use the PGS drivers
from my web site (http://elfsoft.home.mindspring.com) and get the
lists from the READ_ME file.

BTW, I have a standing offer to develop PGS printer drivers for any
printer for which I can get sufficient documentation. For HP PCL
printers, this consists of the resolutions, colors, paper types,
and compression methods supported, plus the exact size of the raster
area and the margins for each paper type. (I was unable to get this
info for my own printer, an HP 5L.)

Alright I know thats very true, but the PC is still essentially a
machine designed for business - a tarted up typewriter if anything.
> i don't know.. i think keeping around your actual Amiga is a lot more
> impressive than running just the software in emulation - i mean how

I wholeheartedly agree, and Ill use the real thing for as long as I
can (I have two 1200's just to make sure) but I never want to get
into the situation when both my A1200's are no longer functional and Ive
effectively lost all that I had just because I didn't back itt u0p
on a PC.
> true about them not deserving it.. but a lot of what i was trying to say
> (albeit rather badly) was that there is no place in the modern world of
> computing for what you call "the great home computers" -
Probably not, but 4 platforms would be a whole lot more interesting
than 2. And I totally agree with Angus you just don't get an emotional
bond between yourself and a PC. This isn't entirely bias, Ive used
Wintel products quite a lot but I still have that nagging thought at
the back of my mind that things could be SO much better.

Hello all,

I have a question concerning HSModem. I have a Hades and am using the file HA_ESCC.prg. Basically eveything is fine. When I am using Cab I get an average CPS of 7000. My question involves the result I get when I do a reset. If I do a Control-Alternate-Delete reset, the computer hangs on the file HA_ESCC.prg in the Auto folder. If I use the reset button, then things boot all the way through. It also hangs if I use the shutdown program in Magic and tell it to reboot. Anyone have an idea as to how I can adjust the HA_ESCC.prg or do something else to fix this?

Now why didn't they document that - I even wrote to SoftLogik about this at one stage, and they didn't have a clue! ;-) Thanks!

> BTW, I have a standing offer to develop PGS printer drivers for any
> printer for which I can get sufficient documentation. For HP PCL

Thanks for the support - For some reason though, your drivers crash under MagiC just as Pagestream begins to print. This does not happen under TOS. However using the info you gave above about the "Special" field, I have been able to use the generic HP LaserJet driver to get perfect output on an A4 page from my Deskjet 600.

Thanks again for the help!

nope, he will need it with a falcon also AFAIK.
IF he is using AHDI he will need it. If he is using ICD or HDdriver then
folders can be set up in the boot file
(icdboot.sys or hddriver.sys)\

Hi Charles

Yes, as usual:-) It checks the date to see if the page is updated.
Works with Dan's ovl.

It's not just multitasking, you told us so much about this fact in your
following phrases,
but I could read _any single word_ about the S.O.U.N.D. !

Man, imagine those tweeeeeting - bleeping - screeeching loudspeaker (!!!)
sounds
the IBM PC used to 'delight' your ear with!

And FOUR-CHANNEL sound - in 1987 ... gosh, tell me a machine that provided
that at
that time.

: "all you zombies" (Robert Heinlein?) is much better. The
circle is
: completely closed, the mian character is his own mother and
father
: thanks to time travel ;-)

Why do I suddenly hear (the national hymn of all inbreeds)
"Duelling Banjos"? How did he become his own mother???

I suspect Heinleins lack of knowledge in genetics allowed him to
write such a story, however, to become the father to a brother
doesn't require time travel...

There was a novel about an American archaeologist who got struck
by lightning while excavating some roman site, he got
transferred to ancient Rome and very soon got in trouble... This
novel is one of the few that "solves" the language problem of
time travel. Our hero, his name is Martin btw, is an expert on
all things roman, and he speaks the correct flavor of Latin
fluently.

A time travel would necessarily be troublesome for reasons of
language/dialect, cultural differences and possibly
race/religion. Not to speak of the possible troubles of being a
female traveller...

Even if travelling only in your own language area you'd notice
how differently people spoke just a hundred years ago. You would
necessarily need to keep your mouth shut as much as possible
also because the things you'd say would logically sound very
strange to the folks of those times. And say you're a tall guy
like me, 191cm, and trying to "disappear" in a crowd of short
people... Hiding your religion would probably be a good idea,
unless it is the same as the one in the target area and time. A
modern day woman's behaviour would most likely be regarded as
very strange and "slutty".

A travelling circus company could possibly "explain" most of
this, strange dialect, strange behaviour and physical features
and also women who "behave like men".

Martin, or Martiu as the Romans call him, uses his modern day
knowledge to produce "firewater" and thus gets accused of
whichcraft by a germanic prince. An accusation that he at first

laughs at, but soon realizes the seriousnes of when hearing what punishment awaits, and the conviction ratio.

If I only could remember the title and author I'd read it again.

How to connect this thread to matters Atari is another problem...
If I travel back in time and rearrange the postings, then maybe...

MG

4516. WDIALOG 2.04/CAB 2.8 Problem

Newsgroup: comp.sys.atari.st
Date: 2000-04-04 00:00:00 UTC
From: jtmartin@gofree.indigo.ie
Message-ID: <CHpG4.1571$sB3.728@news.indigo.ie>
Source record: 63412

Hello all,

I have a rather strange problem at the moment with CAB. This arose suddenly about three or four months ago, but I never really got to the bottom of it. I am hoping someone might have some idea as to what is the problem

I am using CAB 2.8 (used to use 2.7c) and have some form of a conflict with WDIALOG 2.04

When CAB is started with a command line (URL) it does not open the page. However, while running and if a URL is passed via VA_START, the page is opened. Just now, I discovered that if I disable WDIALOG in the Auto Folder, all runs smoothly again (i.e. I can pass CAB a URL hen starting and it will open)

If you need any more details about my system setup I will be happy to provide them.

Thanks,

Jerry Martin

Very easy. DON'T USE HA_ESCC.PRG, it's buggy as hell. I'm really surprised
you still using it. Just use the scc.prg as found in the HSMODA 7 packet.
This works fine.

4521. WDIALOG 2.04/CAB 2.8 Problems

Newsgroup: comp.sys.atari.st
Date: 2000-04-04 00:00:00 UTC
From: jtmartin@gofree.indigo.ie
Message-ID: <0srG4.1689$sB3.944@news.indigo.ie>
Source record: 63417

I have solved the problem! ;-)

A number of months ago, after I registered COMA, I came across a Fax-Driver for SpeedoGDOS and even though I use NVDI, decided to install it to see what would happen! Funnily enough it _almost_ worked. It registered as a driver under NVDI, and successfully rendered about 25% of any page. After this experiment, I never removed the driver. However, it seems that this was creating some problem with CAB's Initialisation, and after removing it, now everything is running smoothly! Phew! ;-)

Thanks,

Jerry

I seen a program or 2 that used the internal speaker to acheive
a 5th channel. Ok not so great, just a trick, but seemed to work. :-))

I would like to take the memory of my old ST2 to the max. I have seen a few postings reagrding memory upgrades that require some soldering--a bit scary for me. My machine has no simm slots.

Is there a relatively easy way to upgrade the ram, and if so, what is the limit?

PS-- I think my tos is 1.x

TIA

The original 400/800 had the key click come out this internal
speaker. It was independent of the other channels out to the
monitor and with clever programming one could get this internal
speaker to do more than click. I assume it was removed on
the XL line, this internmal speaker.

in the gemulator docs it gives instructions how to do this it involves using
the magic ram file in place of a tos image one but I never got it to work.
It's just like Magic PC can run a tos image instead of the magic os but not
many people know this either

: I would like to take the memory of my old ST2 to the max.

The max is 4 Megabyte. Under the diskdrive there are normally 16 chips that make up the 2 Mb you have now. Additional 16 RAM chips can be soldered into the 16 empty places next to the present ones. Problem is they aren't really "empty". They need to get sucked clean from the solder that fills them first, which is perhaps the worst part of this job. You also need to supply 16 capacitors and 3*68 Ohm resistors. It may be a good idea to use sockets under the RAM chips.

Some batches of the Mega ST2 motherboards DO NOT have additional chip places for memory expansion! Uncle Jack Tramiel didn't want us to gain advantages on our own, did he? In those cases you'll have to solve this with SIMM-boards.

: PS-- I think my tos is 1.x

This is no problem RAM-wise. A Mega should at least have the TOS 1.2, which is the first TOS with integrated Blitter chip support.

I suggest you take your Mega ST2 to someone knowledgable who would do the job for you. I've done plenty of these upgrades here in Sweden, and some from abroad as well. As a last resort you can send it to me, send me an email if you're interested.

This has something to do with signal strength and the amount of
distortion in the wiring (new cables might fix this). According
to the SCSI standard, your problem is not supposed to happen...
I've seen it once before though.

Glad you got it to work.

Hi Dan,
The driver software is available for free from ICD's web site.

www.icd.com

Look under "Products". You will find the download link just
above the ad for the "Link2".

Enjoy,
Bytor

Always adaptable.

>-- 1200 baud modem (though I have another spare 14.4 somewhere)

Spare is better. 1200baud almost useless today.

>Two questions:
>Is it worth putting any time or money into? Or are any of the parts
>worth
>the hassle of listing and shipping?

Its not really worth much, although alot of Musicians have been inquiring
for STs as of late.

Is it worth putting time and money into? Are you an Atarian, williing to
experiment with your ST for the sake of a Hobby, or the enjoyment of

making what you have better? If the answer is no, then it is not worth putting money into.

If you have no intention of wanting to use your 520ST on the internet, then it may not be worth your time to want to play with installing and using different internet software. Just for the pleasure of testing the new software out, or validating that purchase you made some many many years ago.

Obviously there are numerous programs for the atari available on FTP sites, new and old. If you hadn't seen or used the old ones, you might want to go back and try programs and games that where made for your Atari, but you didn't have access to.

such as http://www.umich.edu/~archives/atari

Or you might want to try new and current software such as can be found at

ftp://193.190.204.128

Or you might want to check the web out for software that runs on your 520ST. There is plenty to find.

Upgrading and fooling around with your ST can be expensive. But you will be building a better one. Often you can buy a second hand TT or Falcon, cheaper than all the Atari ST modifications you could try to do. This is up to you, to determine where your interest lies. There are plenty of ST modifications available.

However, you can simply start using your 520ST and trying out new stuff, like the internet software, and maintaining contact with the NG, like I have done. Next thing you know you are getting all sorts of stuff for your ST again, like its your newest toy, and sooner or later words like Falcon, TT, Milan , Hades start dominating the thoughts of your mind.

I have fallen into the trap. After one year of using my system, very similar to yours, and coming onto this NG, I have found myself somehow in the possession of a TT, Falcon, Numerous 520STs hacked in various different manners, and some stock, some 1040STs, 1040STes, and 2 MegaSTes to go with a couple of MegaSTs I have. And numerous harddrives etc.

It all gets very addicting and very fun, if you like using your Ataris, and talking to Atari Users. There is a great community here, and I wouldn't trade it or give it up for anything, now having rediscovered it, after pulling my ST out of the closet.

The biggest thing is shaking off the rust. And then actually reading the documentation to the new software. Makes a real difference:-).

>What sort of profitable (cost effective) uses could it still have.

It still does what it did when you bought it. It can display pretty pictures. Plenty of Graphic software available, like Photochrome is available and you might have never tried it. I don't know when you

stopped using your ST, but alot of really interesting stuff was developed in the mid late 1990s.

You can simply download most any internet package today and hook up your 14400 modem and use the internet with it. I use mine for such purposes. The ST you have can do the following internet uses.

WebBrowse, FTP, Email, IRC, mICQ, Newsgroups (Obviously) in both a single or MultiTasking environment.

Using a program like Magic, breaths new life into your ST. Especially if you had TOS 1.0 and never upgraded.

>(note: I long ago went over to the "dark side" and bought a Mac Power >PC)

Nope, the Dark Side is where Terry May exists. But he is still trying to convince us to use the Dark Side of the Force:-).

>Any constructive input would be appreciated

Don't have anymore. Hook it up, see if it still works. See if you have time to start using it. If you don't then put it up forsale or offer it to someone here in this NG for free. These things are usually picked up by somebody, knowing someone will need one someday.

Later Brian.

It's going to involve soldering. If you can get your hands on a memory expansion board, soldering will be limited to a few lines on the motherboard. If you want to upgrade chip by chip on the free spaces that you can see on the board, then that's going to involve A LOT of soldering.

You might consider getting a cheap STE. This, you can upgrade to 4Mb with SIMM modules, plus it has a later TOS version and DMA sound compared to the Mega. You lose the comfort of the separated keyboard though.

```
ACC files are simply placed in the root directory of the boot drive (C:
usually). There is a limit of 6 accessories at one particular time, so if
you have more, only the first 6 will be loaded.

i sent this message yesterday, but I don't seem to have recieved it back,
apologies if everyone else has already seen it:

...
well, I finally worked out what it was, and now both drives are working fine.
I'm not sure why this should apply, but I took Steves advice and checked in HD
Driver to make sure both id's were set 'on' and they were, so as a complete last

guess I decided to swap the device order over so that the new bigger drive was
first in the queue so to speak.
rebooted, and hddriver found it no probs. I now have 2 100meg partitons as well
as the 3 on the 40meg drive all working together.

thanks for all who replied/mailed me, if I'm feeling brave, I might try and get
the 1gig drive I have spare working next .....

cheers, Phil.

Source record: 63430

hello again,

We are starting a project called "st2max" which is in english,
modifying poor old 520STFm to somekinda "superst" what would
include 16MB mem, tower-case, second serial, ide-hd, pc-kbd,
megabus->et4000) at least.

Now i'd like to know if anyone has schematics for 030-based
turbocard or information how to connect same kind of turbocard
for some other machine to st.

Is it possible to connect other pc-cards than et4000 to megabus?
I'd be really interested about soundcards (imagine: <insert soundcard>
with dsp in st).

- darie

Hello,
ask Bo and Ernest Schreurs about their Cas to WAV converter program...
quite interesting background story !! Besides, copying from (Hifi-)Tape
to Tape is easier and to a digital destination (like DAT, DCC, MD, CDR,
CDRW) is far secure (but wastes to much memory). greets- Andreas
magenheimer

P.S. Why not keep the cassettes as original source and use a disk-file
as backup... (if you own the original program, you are allowed to have
backups on any medium)

>thought I saw something posted once about this.

Hi Gadget! :)

Unlike the other repliers who seem to think this is a bit of a joke, you certainly have an application if you are using a Spectrum emulator etc.

To capture a program from tape, you could use a sound sampler and hook up your tape player either into a sound sampling cartridge on an ST or into the microphone socket on a Falcon.

There is a way to then play them into the emulator, but I've never really looked into this.

Cheers!

James

I'm afraid you would be lucky to find one in working condition. Megafile drives age rather badly, and often end up victims of disk stiction. Besides, they are old, small and slow.

I would suggest going for a modern IDE or SCSI drive with the corresponding adapter. At the price of drives nowadays, the adapter will be the most expensive bit. Details in the Quick FAQ.

```
You need to have at look at Vezz's hardware page. The link is in the Quick
FAQ. The DOIT archives might be useful too.

Most of the hardware you describe sounds well beyond the easy DIY project.
Good luck anyway!

Hi Miles!

I don't think you can! :) MagicPC is a standalone PC program, like
Gemulator, so you can't run one with the other.

ie they are both Atari emulators, that can run Atari software.

Cheers!

James

Gee Whiz, that's an old issue! I once had it running with a hard drive, but don't remember how. May have hardcopy instructions somewhere around here. Has something to do with assigning a partition on your hard drive (unless you want to use the whole hard drive), doing an fdisk and format. Voila! That's it!

Doesn't it depend on what version of MagiC you have? From MagiC 6, I
firmly believe, WDialog is not needed.

OK, go on, Steve et al, correct me please. :)

CAB 2.8 is available directly from ASH. The upgrade costs DM 20, you simply send on payment along with your cab 2.7 serial number and they will send along an upgrade disk. Yes, it is english: you use the RSC and HLP files from the 2.7 release. Most of the changes are minor, however, the JPEG.OVL is now JPEG_PNG.OVL -- CAB now supports PNG format images!

Just place them in the root directory of your boot-up drive. (i.e. C:\) TOS
will load them from there. Remember that there is a limit of 6 on standard TOS

I've been a long time getting back on this, but, well, "stuff" got in the way. I thought I'd let you know how I made out.

I didn't get a chance to get to an electronics store, so I eventually ordered cables over the web from Computergate International from Santa Clara, CA. (http://www.computergate.com) After a bit of searching, I found their prices to be very reasonable, and they had cables the rest I looked at didn't.

I never did find an adapter to go from an internal ribbon cable to an external, but I did find a cable with 3 50-pin internal connectors and 2 centronics-type external connectors for around $5. A 3 ft. external SCSI cable was another $5. Of course, shipping/handling across the US wasn't cheap. The cables arrived about 2 1/2 weeks after ordering, via UPS Ground.

The cable had the two external connectors on each end, with the internals evenly spaced in the middle. The layout inside the Toadfile required me to use the middle internal on the internal drive, the next internal on the host adapter, and the external on that end in the "knockout." The unused portion of the cable was secured into a "safe" position with duct tape, much as the original extra power cable had been. Both drives are "terminated."

The Toadfile was SCSI unit 4 so I set the new drive at unit 3 so it would be the boot drive. Once I put everything together and tried it out, it booted from one of my Syquest 44Meg carts perfectly the very first time. I had to partition the 200 Meg carts before I could use them, but reformatting seems unnecessary.

I've been using the new drive for over a week now, and have had no problems. It even seems better at reading the 44s than the Toadfile is. I'm now in the process of setting up one 200 Meg cart for DTP, packing all my clip art where it's handy. No more thumbing through floppies for a simple graphic...I don't know what I'll do with all the extra time.

I think I'm going to be insufferably proud of myself for at least a month-and I deserve it!

4561. ICD Link 2 Software

Newsgroup: comp.sys.atari.st
Date: 2000-04-06 00:00:00 UTC
From: Criminal Minded <danielfl@red.seas.upenn.edu>
Message-ID: <8ch15b$i93$1@netnews.upenn.edu>
Source record: 63257

Hi,

I am trying to hook up a SCSI HD to my 1040STe using the ICD Link 2 and drivers for the Link 1 (the original) that my friend gave me. He said they would work with the Link 2 but when I run install.prg it says version 6.5.3 or higher needed and running icdboot.prg says no adapter installed. I am not the most knowledgable Atari user as you can tell :> I have tried to contact ICD to get the new software but to no avail. Could anyone tell me where I could download it or possibly even send it to me? I would really appreciate it. Thanks in advance.

message news:38EB04DA.AB6E0301@hairstore.fi...

: We are starting a project called "st2max" which is in english,
: modifying poor old 520STFm to somekinda "superst" what would
: include 16MB mem, tower-case, second serial, ide-hd, pc-kbd,
: megabus->et4000) at least.

16Mb ST-RAM? Will be tough. 2Mb of the address space is reserved
for the TOS, cartridgees, and hardware memory mapping. Then I
believe you need to map in one or two Mb for RAM on the graphics
card, leaves you with 12Mb.

: Now i'd like to know if anyone has schematics for 030-based
: turbocard or information how to connect same kind of turbocard
: for some other machine to st.

A 030 CPU would require a TOS suitable for it, a modified 3.xx
probably. Or MagiC in ROMs. Why not bying a Centurbo and see
what you can make of it?

: Is it possible to connect other pc-cards than et4000 to
megabus?
: I'd be really interested about soundcards (imagine: <insert
soundcard>
: with dsp in st).

You can connect any card you like, but it needs specific Atari
drivers, and decoding hardware for the memory mapping to Chip
Enable logic.

I'm looking at USB for the Atari, it's very much work to it
though...

Look at Mario Becroft's projects, he's developing a VME graphics
card among other things.

They should work just fine. Since you have a "bunch" of those SIMMs, you might want to install a set of four matching SIMMs. Mixing SIMMs of different configurations can, in some instances, cause problems.

>
>Right to the point, huh Martin. <g> Well I will give scc.prg and see
>what I get as far as cps while using Cab...

The first months after I received my Hades I was using ha_escc.prg but
just like you I had severe trouble to boot up after a reset.

The same is happen again with the original high-speed scc driver for
freeMiNT. However I received from a nice guy a reworked scc.xdd which
works just great now.

As far as I remember there wasn't any speed different between ha_escc.prg
and scc.prg.

I'm not sure about this but I think you'll only have troubles with ha_escc
when you use MagiC or freeMiNT. IIRC the times I was using plainTOS (very
rare) I never have had that hang problem.

The message you are getting is identical to the one people
experience when they try to use ICDBOOT without an ICD hardware
adapter. Are you sure your adapter was made by ICD?

FWIW, ICDBOOT Pro is the same program with the hardware check
removed. In theory, it costs $15 -- in actuality, money sent to
ICD has been reported to not get anything in return.

Source record: 63272

If all goes well, a Syjet & cartridge should be at my door within a week or so. I'm hoping my ICD Pro drivers are up to the task of partitioning into 2 650Mb partitions and one whatever size is left over (yep, I want to master CDs!).

Does anyone have a Syjet running under ICD? I know of Atarians running Syjets under HD Driver, but that's a much more powerful program.

Galen

It is an ICD Link 2, it says it right on the adapter. When I run ICDBOOT
by itself it says no adapter found, which is strange. I tried getting the
Pro version from them, but like you said they never got back to me.

4579. CAB on MagicMac

Newsgroup: comp.sys.atari.st
Date: 2000-04-06 00:00:00 UTC
From: Steven Kaleita <sak01@chorus.net>
Message-ID: <38ED521E.5F1840D6@chorus.net>
Source record: 63275

Is there a trick, or special CAB.OVL that is specific to running CAB within MagicMac 6?

I have a Beige G3 300mhz, with MagicMac 6.01. Sting dialer gets my connection OK, but every time I boot CAB 2.0, Magic reports a serious error, and I have to terminate the program or terminate MagicMac.

Any ideas, anyone?

SAK :)

4580. Ebay and CAB

I thought I'd pass this on before the storm came.

Ebay has changed their bidding system. I've gotten a report that it doesn't work with my CAB.OVL. However I did a test and just make certain you don't have an Ebay cookie and that you have cookies turned off. I was able to bid with no problems with this configuration.

I might be jumping the gun, but I thought I would pass this information on to everyone.

Ive tried this with HDDriver. It works but I wanted to use the Syjet on my
Atari and PC. My freind has never gotten it to work for me. But it works
perfect with the Atari.

I beleive that with the Link II you'l need a SCSI device that will provide
TERMPWR or the LINK will not be powered, hence the 'No Adaptor'.

Hi Peter,

>BUT I am not sure *what* is being checked - its presence, correctness,
>whether it's up to date or what - the German isn't clear about this, simply
>talking about 'checking'.
The CAB check module checks if the entries in the hotlist are still valid and
if the page have been changed since they were last checked.
If a page cannot be accessed via the Internet its entry is marked as invalid -
but not deleted, in case there is a problem with your Internet connection or
the server is refusing connection.

All pages which have changed or are invalid are displayed in a window. Pages
on that list can be selected and displayed in CAB running under a multitasking
OS. In the CAB Hotlist dialog changed pages are displayed in green, invalid
pages in red preceded with three asterisks "***".

CAB check module options:
Local links: Links are checked to see if they still exist on the
local disk and whether the files have changed since they were
last checked.
Remote links: Links are checked to see if they still exist on the WWW
and whether the files have changed since they were last checked.
Mark changed pages: Hotlist entries of pages which have changed are
marked with a small icon.
Mark errors on page access: Hotlist entries of pages that no longer
exist (even if only in the short term) or cannot be accessed are
marked with a small icon.
Remove markings after ? days: Enter a time limit after which the
icons, used to indicate invalid links, will be deleted. This only
occurs if the CAB Hotlist is saved (i.e. you exit the Hotlist
dialog by selecting OK).
Hotlist (hotlist.html): After checking the hotlist is complete a new
CAB window will be opened to display the file hotlist.html.
Marked entries: The module opens a window listing all marked pages.
If no entries are marked this option is ignored.

I hope this clarifies it a bit.... the CAB check module is probably a very
handy tool for our American friends, but over here in Europe where firms like
BT and the Belgian telephone companies charge us by second, these features are
rather costly... :-(

Cheers from Belgium
Dennis

Don't forget the Link series of host adaptors must be getting power
from the drive's. so check the jumpers on your drive and ensure it
gives power to the host adapor, the Link 2 has a little LED to
indicate that's it's got power to run.. Also the Link 1 will not
support drives that require parity. Hope this helps..
Been there before..

I have an early release of magicMac - I think it's 2.15. I got the
first release out (I think) at around 1.05 or 2.05 (it's down at the
shop and I'm at home). Anyway, it only runs on a 68k machine as far as
I lnow. I used to run it on a Quadra 950 but now the only non-PowerMac
I have is an old IIfx / 32 meg ram.

What did the later updates of magicMac achieve ? Should I consider
upgrading ? I can only run my release on a System 7.x machine. Did
MagicMac ever run under system 8.x ?

Hi Galen,

I have a 1.5gig Syjet for my Falcon. I am using Icd Pro 6.5.5.
Works fine. I have one cartridge partitioned 500/500/500, and the
other 750/750 - that is, if I remember correctly. It's been a
while since I used the unit. So far I have only used them for
back up. I have not yet tried them for digital audio, altho I've
heard they work OK.

Source record: 63288

Dear all,

I Have some old files on floppy that I created sometime ago with ThatsWrite 3, I no longer have my Atari. I would like to be able to access them on my PC.

Would anyone know if there is a program that I can run on my PC that will convert these *.tw files to a format that a PC program can read, like Lotus word Pro say. or if there is a PC program that can read *.tw files.

Any help much appreaciated.

Hi you all.

There is a new version of AHCX.

Long names are now correctly handled by the 'Find multiple' facility.
Line numbers in journal messages were not always correct. Fixed.
Replaced simple TOS filename filtering by a slightly better and more flexible one.
Added a page to the hypertext about 'Find multiple'.

Well I tried out the SCC.prg and it worked fine as far as the reset hanging problem. I also got the same CPS when using Cab. I did notice one big difference. I was having a problem d/l a file (Artwork demo on the ASH website). I would only got about half of it and then Cab would stop the d/l. Using SCC.prg I was able to get all of the file, so I will stick with it until the other file is fixed. Thanks for the suggestion.

I have several running under ICD (6.5.5) on Mega SST, Falcons
and TTs. All perform well for me. Fast, quiet and just work.
Do try to get the pc not the mac formatted cartridges and you
only need to partition and go. You won't have access to the
locking capabilities of the cartridge without additional
software. Never bothered me not having it.

I'm pretty sure there is no program that will directly convert your files.
Why didn't you convert them to ASCII before getting rid of the Atari?

The only way out of this that I can see is:

1- Get an Atari emulator on your PC. There are pointers to this in the Quick FAQ. You also need a TOS image to get the emulator running. There are TOS image files available on the web if you look hard enough, but they are illegal.

2- If you are having trouble copying the .TW files over to the PC, get GEM Explorer from the Gemulator site (http://www.emulators.com). This can read Atari floppies.

3- If you still have the disk, run That's Write on the Emulator. I'm pretty sure it has an export to ASCII option. If not, get Marcel from an Atari FTP site (check the Quick FAQ). Marcel is a text editor that can read most Atari text formats and can export to RTF.

This should get you out of trouble!

For sale, continental USA only.

1 1040 STF, with 1 meg of Ram, mouse, cables, TOS v1.4,
clean, solid working ST. Will let go for $25.00 plus S&H.

1 Syquest EZ-135 removeable cartridge drive, with cables.
Best offer, $50 minimum. Solid, good shape.

Also RatSoft v2.01 BBS software still for sale, price
reduced to $20.00. All manuals.

And...I still have a 4.5 gig external SCSI hard drive
for sale, complete with cables, ICD host adaptor, software,
etc, etc,...less than 2 years old, with 1 drive bay open.
Paid $506 for this setup from Dirt Cheap Drives. Best offer
so far is $175.00... well worth the money. Great shape.

Later...

PS Send all replies via E-mail. Thanks!

Hi All,

I have recently been trying to set-up my own web site.
Using Newsie I have been able to upload html files to
my isp's web space but I am not able to delete or rename
any of the files.

I have also tried with MG-FTP and A-FTP but neither can
delete or rename files in my web space.

The guys at my isp have checked everything and they reckon
all is well.

Is there something obvious I am missing ?

I am using Sting, from a Mint powered Milan and my isp is
Freeola.

Thanks in advance,

Peter

TW files can be converted to WP5.1/WP6.x files by
Robert Best's programme TWP

How many text files do you need converting??

If there are only a few you could send them to me and
I'll send you the WordPerfect in return...

Hi Robert!

I'm pretty sure that there is a program that converts TW files to
something else but it's an Atari program (I think it's called TWC or
something like that, but don't quote me!!). I don't have it anymore
though.

However I do still use TW3, so if you want to send the files to me by
email, I could convert them to ASCII (though of course you will lose
formatting, fonts etc - but at least you'll have the bare text).

Cheers!

James

Hi Peter!

When I setup my website, I too used Newsie (and tried the others too) but
I didn't like it like you.

Now I use gapFTP by Gary Priest. Find it on:

http://www.the-gap.demon.co.uk/

This is a TTP (you type the server address in the TTP Parameters box)
commandline program, similar to MS-DOS on a PC, but it's miles better than
anything else around, and it does do deletes and renames. It also works as
a plugin for Cab.

It's meant for Stik/Sting, but as you use that already thats fine for you.
I don't know if it works with Ifusion for Iconnect though. (I'm also a
Sting user).

Cheers!

I hope that she used a hard to guess password. There are hackers out there
that employ programs that will try all kinds of common passwords on a target.

I'd also be curious if her ISP updates their server software on a frequent
basis. Cause if they're not, time to give them a call....

Another common weak link are those who have access to the passwords. Social
engineering is another common tactic used for intruding systems (basically
tricking somebody into giving you their password/access to their system) The
best defense against this is educating people.

> If an Atari can do it, he'll do it. :)

I had System 6.0.8 running on my Spectre. I don't think even Dave Small
was successful at getting 7.0 to run.

As for PCDitto, I still have my 1040STf with the board installed. It
came with a users manual, which I -should- still have somewhere. I run
across it once in a while. Unlike John, I don't remember having to use
fdisk to use the hard drive. The instructions on how to use a hard
driver were in the manual, tho'. Unfortunately, I learned the hard way
that defrag programs for the hard drive, either Atari or PC based, could
not be used on the partition(s) used with PCDitto. The Atari programs
would move PC hard drive info that needed to stay in a certain place,
and vice versa. <G>

I have a help page on converting Atari word processor files at:

http://www.whalley.demon.co.uk/atari/texts/wp_help.html

Robert Best has written a utility for converting That's Write files to
Word Perfect format, available from the author's web site:

http://home.wxs.nl/~rwbest/conv.html

NB: updated URL - the one on my page needs changing (hopefully this
w/e!). AFAIK this is the only program which can convert TW files to
anything PC. Most PC word processors (Word, Lotus and WP itself) will
open WP files.

The programs only run on Ataris. You may therefore have to try them on
an emulator.

My page has a few tips on getting the files onto a PC which you may find
helpful.

Unless the poster of this question has detailed knowledge of the way that the
Atari 8-bit computer loads and runs selfbooting programs and has a machine
language monitor installed, he's not going to be able to convert the files to
run from disk.

This setup sounds exactly right, but I question that you have both drives
terminated. The only device that should have termination set should be the last
one in your chain, your host adaptor should also be terminated - that's taken
care of by components on its circuit board.

4616. SM124 problem

Newsgroup: comp.sys.atari.st
Date: 2000-04-07 00:00:00 UTC
From: arthurm@zetnet.co.uk
Message-ID: <955107206_OASIS_@zetnet.co.uk>
Source record: 63362

I run a 4 meg STFM with the hires SM124 monitor. The pictures still ok but is now leaning at an angle down from left to right. Is there a pot somewhere to straighten it up again before
I get a permanent crick in the neck?

Hi Peter

I'm using aFTP on my Mint powered Milan using Sting without any problem.
What version of aFTP did you try? Have been using 1.54 and 1.55 both
deleting and renaming was smooth.

4619. Buy CAB 2.7 now, or wait for 2.8?

Newsgroup: comp.sys.atari.st
Date: 2000-04-08 00:00:00 UTC
From: taj16@dreamscape.com
Message-ID: <set7u6bgcqv156@corp.supernews.com>
Source record: 63365

I've been using the CAB 2.7 demo with StinG 1.22 and CAB.OVL 1.31 for a little over a month now, and I've decided to get a full version. I don't know what to do, though. Should I get the full version of CAB 2.7 now, or keep using the demo version until there's a US version of 2.8?

Does anybody have an idea when a US version of 2.8 will be available? If it's too long, I might as well buy 2.7 now. What are the differences between 2.7 and 2.8? Would 2.8 be worth the wait? If I buy 2.7 now, and there aren't many improvements in 2.8, I'll probably stick with 2.7 even when 2.8 is available. If I wait for 2.8, I'll have to continue to fumble around with a program that has docs written in German-that I can't read, and I'll probably use it to less than half of its potential.

It's a difficult choice. I need help making it.

4621. Video Shifter on STFM... where?!?!

Newsgroup: comp.sys.atari.st
Date: 2000-04-08 00:00:00 UTC
From: Derek Warren <macgod@rocketmail.com>
Message-ID: <07042000215846625O%macgod@rocketmail.com>
Source record: 63367

Hello all!

I'm trying to do the 1.44MB floppy hack with a few of my STFMs.
Problem: the doc I'm working from (Randy Kwak's 1.44MB FD mod,
available from the Quick FAQ) refers to the CO25914 (the video
shifter). The closest chip I can find is a PLCC (60 pins) labelled
CO25915...uhmm... good enough? Perhaps not! According to the part
number at http://www.myatari.com/bc520hw.txt, that's the GLUE chip.

Can someone point me in the right direction here? =)

Cheers,
Derek

That's not to say you couldn't buy a USB serial port adapter and use that in combination with a serial cable and a comms program... I suggest Black Knight on the Mac end (ZTerm, after all these years, still does quite a nice job, too..)

Keyspan makes such a serial adapter. (http://www.keyspan.com/ or go directly to http://www.keyspan.com/products/usb/usa28x/)

ZTerm and Black Knight (along with many other comms programs) can be found at http://hyperarchive.lcs.mit.edu/HyperArchive.html

Cheers!
Derek

N.AES is grapically more pleasing, somewhat faster than 1.2 and
rock-solid. Also, it can be exited and re-entered several times
even when started from /etc/ttytab as a console. Finally, it
comes with its own Wdialog clone that is about 80% compatible.

As for the CD, there isn't much to write home about: it's a
best-of of whatever they could find over Mausnet and some of the
most recent kernel and filesystem drivers. The main reason why I
chose the CD is that floppies tend to demagnetize and corrupt
themselves over several reading operations, while CD's do not.

Hi Thomas

>Does anybody have an idea when a US version of 2.8 will be available?

US version, there are English resources available for use with the German
native version already.

>If it's too long, I might as well buy 2.7 now. What are the differences
>between 2.7 and 2.8? Would 2.8 be worth the wait?

AFAIK there are not many differences apart from a PNG display facilitly
what ever that is, some type of new graphic format i believe.

Thanks, Steve--however, the socketed chip inside the shielded can-thing
is labelled CO40713.. aarrgghgh!

I looked over Zaphod's floppy mod. notes and it suggests using pin 2 of
the STE MCGLUE (the pin that transmits 16MHz clock).. anyone know which
pin of the ST/F/M GLUE chip does the same thing?

I've checked around on "ST Internals" and stuff but have been
unsuccessful. :(

Cheers anyhow,
Derek

There is a *very great* different between 2.7 and 2.8 when it becomes to
view progressive .jpg's. Cab 2.80 loads very much faster this type of
jpg's then Cab 2.70.
As test I've loaded a page containing 13 prg. jpg's

No it isn't. The STE Glue includes the video shifter. On the STFM, the
shifter is inside the metal shielding. The one you have has a different part
number, but I'm pretty sure it's the shifter. Why else would it be inside a
metal box?

> metal box?

Thanks, Nick! I also pitched the question to c.s.a.s.tech and I got the
same answer--the CO70713-002 is the shifter. (Note in case anyone else
refers to this: CO70713 is the correct number, not CO40713 as
previously posted.)

The CO70713 is on the newer of 3 STFM motherboards in my closet; the
older two have the CO2925914 shifter. I swapped chips and everything
seemed just fine..

Once finished, I hope I can use the board for a few years without
blowing the WD1772. <grin>

So how is Wensuite? Looked at demo, but doesn't allow online trials.
Seen some bashing of it in this newsgroup. I see it's fast here. Main
problems with CAB are lack of access to secure sites and Java-requiring
sites.

Hi Martin,

>A 030 CPU would require a TOS suitable for it, a modified 3.xx
>probably. Or MagiC in ROMs. Why not bying a Centurbo and see
>what you can make of it?
It's very unlikely that the Centurbo will work in an ST. A better solution would be the PAK/68 kit. This comes with a 68030/50Mhz processor, Fast RAM expansion and modified TOS 3.06.

More info from:
Wolfgang Rohmann & Roland Skuplik (WRS Design)
mailto:narses@cityweb.de>

The same people also make the Panther II interface, this is a graphic card adaptor for the ST and MegaST, it features is an additional ISA bus, so two ISA cards fit, one could be a graphic card and the other a 10mbit ethernet card. Some drivers for the ET4000 and Novell network card come with the interface...

All of the above can be installed in a simple 520ST, but will probably cost more then a brandnew Milan. The Milan I is now priced at $750 in Germany....

>I'm looking at USB for the Atari, it's very much work to it though...
Various firms offer a Serial ==> USB adaptor, so isn't it just a question of writing an appropriate driver?

Cheers from Belgium
Dennis

: > there was a newer version that might be more appropriate.

: GFA-Basic is a much better basic than ST-Basic, which is probably the
: one you mean. But it would still be very difficult to port VB programs
: to any other basic, I think.. It's a very big language..

Not to mention that VB apps call to a lot of compiled code that was written in C/C++ (DLL, VBX, OCX). In GFA one would have to find equivilants or else write their own code to do the same things. Some of it I suppose is in the resource editor.

There's more coding effort in a GFA program. The nice part though is that one gains more control over the program execution. In VB I feel I have less control even though I can develop the interface in a snap. I guess it's just one of those trade offs.

Compared with Adamas 1.7 Wensuite 3.30c is not that bad. There is still lots of work to do but at least it doesn't crash on my Hades which I can't say of Adamas. I'm extremely lucky when I can keep Adamas alive for more then 5 minutes. Furthermore Adamas still can't render some colors good. Take for instance a pale blue "#d4ebf9". With Cab 2.80 and WS (and Netscape) it's pale blue alright but Adamas renders this color as a bluish green. The same happens with a pale yellow "#F8F7D9". In Adamas this color will appear as an awfull kaki
Both Wensuite and Adamas won't solve your problem with secure sites and java.

BTW: I almost forgot Adamas is rather slow too. For the same test page Adamas needs 1.22:80.

According to the docs of Adamas 1.63 pro javascript is supported but I *NEVER* could access a page which contains javascript.
AFAIK, the demo of Adamas 1.7 pro doesn't support javascript so I couldn't test it to see if the previous problems are solved.

Both Adamas and Wensuite comes with their own TCP/IP stack which is IMHO not a very wise decision. For both there are telnet, news, mail and ftp clients but they all can't compete with the STing/MiNTnet clients. Especialy Marathon (the Draconis mail client) is rather bad.

Please note that the above is just my experience. Some guys are very happy with Adamas.
Adamas 1.7 demo (English version) is available on
http://dc2.uni-bielefeld.de/atari/draconis/edownl.htm

With Wensuite there seems to be connection problems. I'm a lucky guy I guess because I din't had a problem but I do know some Dutch which aren't that lucky. Whatever they try they just can't make a connection to their ISP.

The inbuild mailer and newsreader seems to be reasonable good. Because WS needs it's own TCP/IP stack I didn't test it throughoutly.

Hey I'm surely not an expert but isn't that so that MFP and SCC aren't the
same. MFP is for the modem 1 (and serial 1 with MFP-TT) whereas SCC.PRG is
for the modem 2 and serial 2 port.
A TT for instance has 4 serial ports so I've you want to use then all you
need to install MFP (modem 1), MFP-TT (serial 1) and SCC.PRG (Modem 2 and
serial 2)

4653. ZIP problem

Newsgroup: comp.sys.atari.st
Date: 2000-04-09 00:00:00 UTC
From: ai063@FreeNet.Carleton.CA
Message-ID: <8cqgkp$6ni$1@freenet9.carleton.ca>
Source record: 63307

I have been using a ZIP 250 at the end of a SCSI chain of two SyQuest EasyFlyer 230s quite happily for many months. However, I had to leave the ZIP unterminated, in spite of the Iomega manual, or the drive didn't show up at bootup time.

My setup up is 1040STe>ICDLINK>terminator>SyQuest230>SyQuest230> ZIP250 (unterminated.

Quite recently the ZIP has developed a strange and annoying characteristic: it keeps ejecting the disk, no matter when I try to insert it. The drive shows up under ICDBOOT.PRG but no partitions, of course. I've tried inserting the disk at several times during the bootup process and after, without success. I tried switching in the ZIP's own termination, or adding an external terminator, and all that happened is that the ZIP didn't even show up on bootup.

Under the circumstances, the ZIP drive is pretty useless. I wouldn't be able to use later versions of HDDRIVER (which I don't have) to modify the drive's parameters (like changing the 'sleep' period), if there are no partitions available--or could I? I do have ver. 6.1 of HDDRIVER, but I haven't tried it out to see if it would work.

Anyone, perhaps Uwe Seimat, have any suggestions?

various reasons Atari Today wont make it
>to the SAMS2000 exibition this year :-(.
>We still hope to complete issue 1 soon however
>and will post details when its available.

I guess it's around 6 months now since you first floated the idea of the magazine, and you appear to have blown hot and cold over it ever since ;-)

You've promised to be at the last two Stafford shows, but both times you've cancelled with days to go.

I'm sure you have very good reasons as why this is, but sadly, your on/off approach to doing the magazine has so far scuppered one very definite plan to do a new printed Atari magazine and judging from the comments made to me you have caused a lot of confusion to potential readers as well.

Bob, I think you would be better off if you came out with some definite publication dates and stuck to them. If this is impossible (if you have valid reasons then we'll all be understanding), then perhaps you could say so and at least let anyone else thinking of doing a printed magazine the chance to do something.

With ST Computer in Germany offering free licences to reprint their content I guess that there are one or two people thinking about doing a English-language version of this magazine?

Please take the above comments in the spirit that they are intended and I wish you all the best in your efforts.

: include 16MB mem, tower-case, second serial, ide-hd, pc-kbd,
: megabus->et4000) at least.

I have made a AT keyboard interface for the Atari called Qwertyx. You can read something about it on my WWW page at http://gem.win.co.nz/mario/ or email me if you want to know something about it. I also have made an IDE interface board. Another person (Pera Putnik) has made available schematics for an IDE interface which he has kindly published on the WWW, although I do not have the URL on hand.

I suspect the best way to add a second (and third) serial port would be to add an SCC chip of the sort used in the TT and Falcon since this is already supported.

16 megabytes of memory will be difficult on a 68000 since 2 megabytes is used for ROM and IO and the ET4000 card will need some memory. However adding maybe 12 to 14 megabytes would be easy. Of course if you go up to an 030 there will be no problem with 16 megabytes.

I started to design an 030 board for an ST but I have not been able to finish it yet.

I am currently working on a VMEbus graphics card, which could be adapted to the ST, and a SCSI/ACSI - ethernet adapter.

I would be too. <g> I would get ahold of Nima from Homa Systems and see
if any of his drivers will work with it.

That is great, but I would love to try out the Javascript module that
the professional version comes with. The demo does not have it. But if
someone can confirm that it works I would buy it just to get on those
sites that Cab cannot. There is a local Home Banking Site that I would
love to get on.

: It's very unlikely that the Centurbo will work in an ST.

Why?

: A better solution would be the PAK/68 kit.
: This comes with a 68030/50Mhz processor,
: Fast RAM expansion and modified TOS 3.06.

Didn't know this one was still on offer.

: Various firms offer a Serial ==> USB adaptor, so isn't it
: just a question of writing an appropriate driver?

Maybe, but this solution would be quite disappointing speedwise.
If you, on the other hand, see any SCSI ==> USB adaptor then
that might be more interesting. Best of all, costwise, is a
solution without any translations to or from other buses or
ports.

> then 5 minutes.

Hmmm...curious. I first got interested in Adamas while doing my FX
accelerator article in AC14. I couldn't keep CAB alive that long, but
Drac/Adamas was rock solid when running the FX at 40MHz CPU. Had the
problem of the demo 10 minute time out though. Have never gotten
Heitmann or MUCS to respond to my inquiries to buy a copy though.

> Furthermore Adamas still can't render some colors good.
> Take for instance a pale blue "#d4ebf9". With Cab 2.80 and WS (and

I've heard alot about incorrect colors. I can see this just in the demo
packs by loading each others sample pages. Not a real big issue to me,
except when a background color is rendered so dark that the overlying
text is unreadable.

> BTW: I almost forgot Adamas is rather slow too. For the same test page
> Adamas needs 1.22:80.

Hard to see how one browser can do it in a few seconds and others
require minutes....

Oops! I missed that detail. I was about to see if the Adamas demo would
get me into my Netscape web mail, which CAB won't for that reason.
>
> Both Adamas and Wensuite comes with their own TCP/IP stack which is IMHO

A shame to see further fragmenting of the Atari world. Ifusion works
well for using STinG clients with Drac/IConnect, but I would like to see
it go the other way around too.

If the display is otherwise not distorted you should look around for any magnetised apparatus (speakers etc.) which you have recently placed near the monitor :-)

It could also be due to the small permanent magnets mounted on the tube neck which have come adrift.

This is a funny fault as the electronics deals with more complex distortions than a simple rotation!!

Hi folks,

Does anyone have a set of english installation instructions for a Tower Power case?
I've just dug mine out of the attic in bits and I need to know what goes where for:
1) the tripledrive adaptor.
2) The new reset switch.
3) The external keyboard.

The only instructions I have are a bad photocopy of the German instructions,

GFA-Basic is a much better basic than ST-Basic, which is probably the
one you mean. But it would still be very difficult to port VB programs
to any other basic, I think.. It's a very big language..

Hi Galen,

>I'm hoping my ICD Pro drivers are up to the task of partitioning into 2
>650Mb partitions and one whatever size is left over (yep, I want to master

>CDs!).
650Mb is not enough, you should at least have a 800Mb minimum partion on
that drive, if you can afford the space then 1Gig is even better. The other
partition if used for an image doesn't have to be that big, somewhere at
the 700Mb region will do just nicely...
Once that you start copying files to that partition, the entries in the
directory take a lot of overhead... 1 entry = 32Kb....

Cheers from Belgium

Hello All:

I am happy to announce that after contacting him, Bob Melvin (now at MOTU) has allowed Free trading of his excellent CAGED ARTIST series of synth editors. Quite a few of them are now available at my site with screen shots and a tutorial.(see sig) here is the lst of available editors:

4-Op Deluxe:Editors for Yamaha Tx81z,Fb01,and other 4 op Synths
CZ-Rider: Editor for Casio CZ series
K1-Edit: Editor for the Kawai K1
K5-Edit: Editor for the kawai K5
MT32: Editor for the Roland MT-32
PCM70: Editor for the PCM70 effects unit.

Thanks go to members of the Atari-Midi mailiong list for providing downloadable copies.

However..if anybody here has any "unprotected" copies of any CAGED ARTIST series that is not on the above list, please send them to me so I can add them to the download area so everyone can enjoy them. In Particular, I am looking for the DX-7 editor.

Anyway...looks like we got another one!! (or two..or three)

Thanks for the suggestion. However, even with all of the .NOT files deleted, it still brings up the file selector at the boot completion (when MGNOTICE is enabled in the START folder).

And I've recopied MGNOTICE and all of it's associated files from a couple different backups, and re-ordered the programs in the START folder, but nothing worked.

So, I guess I won't be using MGNOTICE any more...

Falcon's
: "processor direct slot" which the ST of course does not have.

Well... I suppose that this is not the way harware buffs look at it. The presence or absence of a dedicated *connector* is secondary in these cases. What's interesting is the signals and their timing. Off hand I'd imagine that the types of signals on the CT2 board are pretty compatible to what's available in an ST. After all, we're talking MC68xxx relatives here.

What most likely is not compatible are the signal timings. Some kind of GLUE logic would be called for here I guess.

Many years ago I used to read car magazines. There were sometimes articles on people who put in a hairy turboloaded boxer-6 engine from Porsche into a VW Beetle. It is possible to do this, both engines are boxers, both are in the rear, aircooled and they're actually "family" being designed by the same engineer, Ferdinand Porsche.

So what does the Beetle driver discover first when he tries out his new trimmed VW? That he needs much more effective brakes with the new engine. And better tyres, and better suspension and reinforcements in the bottom plate, and maybe a reinforced coach too, and a new fuel pump and tank perhaps... And so it goes on without end. It finally turns out that he could have bought himself a real Porsche for all the money and work he spent on the various conversions.

We have the same situation with boosting up the performance of an old ST. First a new processor, then another TOS, and so on. The experience with the CT2 on the Falcon shows that not even a Falcon is worth the trouble of hardware upgrading. The CT2 is excellent, but the rest of the Falcon is like a millstone around it's neck. The cost of a CT2 was about the half of a new Milan. But a Milan is totally more than twice the better machine.

Sooner or later all boils down to how much bang you get for your buck. The ST series had in their days several advantages speaking for them. Midi connectors and software like Cubase, Calamus DTP, cheap to buy, the great mono monitor and a brotherly community.

Today's Atari clones don't have any edge at all compared to the mainstream PC and Mac machines. They're also handicapped by the absence of a capable web browser. Software is scarce and costly.

A modern day Milan or Phenix or whatever clone, would need to ***at least*** fullfill the following requirements:

Must not cost more than a (perceived) similar system from the Intel world.

Must have support for mainstream peripherals, PCI cards, AGP graphic cards, printer drivers, USB drivers etc. In short, all that you can put into a PC you should be able to put into your Atari clone.

Be equipped with a mainstream operating system like Linux or BSD (Berkely Software Distribution, a free Unix), which includes the major free sofware releases that today come with such OS:es, namely KDE, Gnome, Netscape, Star Office, Adobe's Acrobat Reader and many others.

And when it has fullfilled all of the above it still has to have some kind of "killer application" or edge, compared to the PC world. Something that would make it worth while choosing this "odd" platform. What that killer application could be is beyond me. An educated guess would be "the ability to understand human speech". No other system has come very far in this area. Or some CAD system that would allow the user to swiftly compose his own porn...

Hi Raymond,

I'm using Logic Audio Falcon 2.01. I think there's a little
improvement between 2.0 and 2.01, altho I can't remember what
now. 2.01 is available off the web - FREE, but you do need the
LOG-3 dongle and other files you already have for 2.0. Go to:

ftp://dir.mcc.ac.uk/pub/emagic/LOGIC/UPDATES/ATARI/

For some reason they put it in 2 formats - one compressed, the
other not. LAF0601 is the one to get.

If you think your questions might of interest to this newsgroup,
you can reply here, otherwise just reply directly to my email.

>Interface. It's rock solide.

RSM and Interface have their good and bad points - RSM lacks Interface's "Find" ability (but that can be got round by searching in the file produced by the companion Resource Text Replacer), but RSM's multi-layer RSC file is becoming the standard. Keeps all language variants in one RSC file.

But that's off the subject in question.

Hi NG.
Anyone got a god idea.
I seems to have lost my harddisk on the Falcon, that is, I can get
access to the drive if I run hddriver after a boot, but it will not boot
from the hd anymore.
It doesï¿½nt matter if I put in another hardrive that use to work, the
Falcon will not boot anyway.

What can be wrong?

Itï¿½s a IBM 4 Gb travelstar, and it use to work without any problems,
well most of the time, if I donï¿½t do anything stupid.

Cheers

Joergen

4691. Announcing the MIDI-3

Newsgroup: comp.sys.atari.st
Date: 2000-04-10 00:00:00 UTC
From: mb@gem.win.co.nz
Message-ID: <Fss1HM.Gt@gem.win.co.nz>
Source record: 63327

ANNOUNCING THE RELEASE OF MIDI-3

MIDI-3 is a 3 MIDI output expander which attaches to the serial (modem) port of an Atari ST computer. When used in conjunction with MIDI sequencer programs such as Notator and Cubase, MIDI-3 provides 3 extra independently addressable MIDI outputs in addition to the Atari ST's standard MIDI output.

MIDI-3 is fully compatible with the original C-LAB EXPORT expander (no longer available), and works with any software that supports EXPORT.

SUMMARY OF FEATURES

* Provides 3 extra MIDI outputs on Atari ST or compable computers.
* Attaches to the serial (or modem) port.
* Fully compatible with EXPORT.
* "Plug and play" installation.
* No external power supplies or other connections are required.
* Available in cased (external) and uncased (internal) configurations.
* Very compact dimensions.

PRICING AND AVAILABILITY

MIDI-3 is available immediately in cased and uncased configurations. The cased configuration is suitable for external connection to a computer, while the uncased configuration would be useful for mounting inside a recased Atari ST.

Pricing for the MIDI-3 in New Zealand Dollars is as follows:

MIDI-3 cased: 110 NZD (40 GBP, 60 USD)
MIDI-3 uncased: 100 NZD (35 GBP, 50 USD)

Figures in Great Britan Pounds and United States Dollars are approximate and for reference only.

Quantity discounts are available in quantities starting at 5 units.

news:8cr102$vt1$1@newsg3.svr.pol.co.uk...
> Has anyone managed to get connect to the net with MagiC PC and STing?

Yup! I'm using MPC 1.2 (latest English version).

> If so how did you do it??

I just copied the stuff from my STE over (being a lazy so-and-so I
created drive mappings emulating my setup on the STE - saved
reconfiguring lots of things, not just STinG).

I had trouble to start with, though. I spent ages fiddling with
settings, only to eventually discover that CACHE.DNS was the problem: I
deleted it so STinG recreated it and suddenly everything worked.

> any advice??

Make sure your auto folder is running everything in the right order -
easy to do with MPC as you have to use autoexec.bat anyway. I'm using
HSMODEM as preinstalled by MPC, just make sure STING.PRG runs after it.

FWIW, my autoexec looks like this:

```
; AUTOEXEC.BAT for MagiC PC
; this batch controls the auto folder boot sequence
; only programs listed here will be executed
; please add Your own auto folder programs here
JAR30.PRG ; adds extra cookie jar slots as I ran out
NVDI.PRG ; NVDI (nooohh...)
ncaldrv.prg ; NVDI screen tweak for Calamus
MAGCUFSL.PRG ; makes MagiC font selector available to other programs
DRVIN.PRG ; HSMODEM loader
MFP.PRG ; HSM driver for serial port
STING.PRG ; STinG
SOCKETS.PRG ; Iconnect - never got very far with this (ought to disable
it again)
MAGICSCR.PRG ;should be the last program in the auto folder
```

ISTR that when I originally set it up I also had to set the serial port
speed using the STinG port setter CPX to the same as that set for MPC
(115k in my case). Just to state the obvious, you also need to tell MPC
to use the PC serial port your modem is on.

BTW I'm using STinG 1.15 - I believe that you have to install HSM 7 to
use the latest STinG and I'm not sure what the settings are for MPC as

HSM 6 is preinstalled. As I don't use it that much for net stuff I
haven't upgraded either.

You say "quite recently", i. e. initially everything worked fined? IN this
case the drive is most likely broken. At least something must have changed
regarding the drive or your configuration that caused a different
behavior.

> Under the circumstances, the ZIP drive is pretty useless. I wouldn't

It doesn't matter if there are partitions or not for changing parameters
of a ZIP drive. These parameters affect the medium in a drive as a whole
and have nothing to do with the logical layout (partitions).

Source record: 63338

As for Spectre, why don't any Ataraians look into Christian Bauer's new open-source Mac emulator, Basilisk II? It's already been ported to Amiga, Linux, NetBSD(?), even OS/2 and Windows, IIRC. With the common processor, it should run quite quickly on the thirtytwo-bitters, not to mention offering newfangled features such as colour graphics and OS 8 support.

I copied everything over from my STE over and put it in the places where it should be on my MagiC C drive and rebooted.The modem's DTR light stays on which it should be off until I go and dial up.I run the dialer and click on enable and the modem light goes off,trys to reset the modem,ATZ,thats where it stays.I can use Fax software with MagiC PC but at the moment it just doe not want to play...What am I doing wrong???

Thanks,

Gordy.

I could use connect the coms prg with magic pc, in the end I put it down to
something in my pc I even tried an external modem . Iconnect dialed but
then cab just sat there waiting, after weeks faffing and connecting with
tosbox I wondered why I was wasting my time as for browsing and
compatibility IE5 was so much better and faster

The final version should come on the market soon. I have ordered it so I'll let you know if the Java script module works well. In version 1.63 it was implemented but it didn't work at all. Maybe this has been corrected.
cheers

I've just tried Draconis on my Milan.
It crashed with the first html document I opened.
I gave up.

Run the utility program for HHdriver. Gone under options and make sure
hyour drive number is highlighted. Save it out and re-boot. It should
work. Also, make sure the boot drive is set correctly.

Maybe a corrupted NVRAM. Enter the CT2 BIOS (by holding the
[Help] key while powering-on/resetting) then press the
combination [Alternate]+[Undo] to reset the NVRAM. Next,
reconfigure the drive parameters [F8] (FDD present; and make
sure your boot device is enabled and first in the list).

The Falcon's case is also not very stiff, and allows the
motherboard to bend quite a bit, so maybe the movement
introduced an intermittent contact. Open the machine and
re-seat the CT2 and ST RAM.

no, that one didnt work at all, it claims theres no floppy attached to the system, and no scsi can be found at all.

>
> The Falcon's case is also not very stiff, and allows the

tried this one too, i went over the PCB checking for any loose wires or so but none found.

Can it be DMA related? Since i cannot use floppy or scsi i cant really try any program.

regards
Fredrik

I have the Epson ES1200 and it's terrific! I wish I could get a ADF for it. GT Look works perfectly. AFAIK Nima does not have a driver for it although I had asked him several times over the years to do so. Thus far SOL but GT Look works really well.

4716. Draconis

Newsgroup: comp.sys.atari.st
Date: 2000-04-11 00:00:00 UTC
From: sonik@ukf.net
Message-ID: <38f33803.0@news2.cluster1.telinco.net>
Source record: 63212

Hi folks

I saw someone's posting on here the other day and thought I'd have a bash at this here Draconis net suite thing. After several hours of wrestling with the configuration - despite the wizard with it - I enslisted some help from the postee and also from the developers.

I did as I was bidden and deleted it all to re-install on my boot drive (C:/). The developer then said that I had to disable STing completely (i.e in the Auto folder as well as in the CPX) and so I tried this. The ongoing problem I've found, despite this, is that Draconis's dialer handles the connection to my ISP ok and logs on, there seems to be very little going on after that in the way of data transmitted or received. I tried to check my mail with Marathon Mail with no joy and then tried to surf with The Light of Adamas (pretentious name) the web browser but sod all happens. The modem lights flash a bit initially but then, like Craven Cottage after the Super Bees have stuck a fifth goal on them, 'it's all gone quiet over there...'.

So, if there's any Atarian who preferbly speaks English as a first language - these things can lose something in translation! - I'd like to hear from them for some ideas, especially if they've got there Draconis setup running ok. Also a word to Draconis's developers: why in God's name didn't you make your package STinG compatible? It is inconvenient to have to disable a *working* connection in order to use your clients!

I'm all for encouraging new net clients for our platform but when they're up against such stiff competition as POPwatch, NEWSie and CAB, it would be a good idea to have them actually working!

Cheers for any info :)

This is not really an answer but I tend to set (if possible) the
logfiles and other similar files to the "waste" folder within Jinnee
and then one click clears the whole folder - but as I say this doesn't work
for logfiles created by programs where you can't specify the log directory.

I just don't understand why!?! A Macintosh Plus could run something like system 7.5.3 or something like that. At least a low level version of 7. What was so unique about this form of Macintosh emulation that it couldn't be a complete Macintosh Plus?

Any ideas?

It might be so, but where do I find the host adapter?

BTW, the cable is OK, well I think its is, because I can get access to
the harddrive if I boot with a floppy and HDdriver.prg in the
autofolder.

If I try to put in the old hardrive, a 120 Mb. with AHDI, it will not
boot from this drive either, even if it use to work before.

It only happened when I changed MFP.PRG to SCC.PRG. Up until that point
MagiC had loaded up without bombs. To test I switched back to MFP.PRG and
the bombs at bootup didn't appear.

First of all, thanks to everyone for responding. I'm awaiting
my stuff with baited breath (& empty bank account).

Dennis, I'm still not clear why I need 800Mb for a 650Mb disk.
Are the files on HD larger than those written to the CD due to
sector sizes or something?

Galen

P.S.: For what it's worth, I have a one letter email
address, "K". A couple of people have gotten lost trying to
email me. The @uia.net stuff is straightforward.

Xboot could be configured to do this, also running a CLI as an auto running
APP (only possible with some TOS's) with a batch script would do it.

I concur with Keith, the ES1200 works pretty decent with GT Look, much
better than the $99.00 Mircotek I returned a long time ago. AIRC, the
ES1200 was about $2500.00 back in the day.

Hi all,

I'm posting this on behalf of a long-time Atarian who has now to dispose of a whole pile of Atari stuff - including an ST and a pile of magazines, a scanner and so on.

The deal is that you collect from Bishops Stortford (Herts, UK), and make a donation to a school.

If this stuff isn't cleared it's to be sent to the tip, so I urgently suggest that you get in contact with this chap. Email me for his address - derryck@cwcom.net or take the antispam from the address in the header of this message.

Maybe another alternative OS for the old Atari ST:s?

The Linux/Microcontroller project is a port of the Linux 2.0 to systems without a Memory Management Unit. At present, only Motorola MC68000 derivatives are supported. The first target system to sucessfully boot is the 3Com PalmPilot with a TRG SuperPilot Board and a custom boot loader they put together specifically for the Linux/PalmPilot port. Thanks guys!

The port of Linux to systems without MMU was done during the last week of January, 1998 by Kenneth Albanowski and D. Jeff Dionne. As with all ports of Linux, this is free software under the GNU Public License.

Find out details on the www.uclinux.com website.

> --
> Trevor
> 6 MB ATARI STe / Veloce+2

SCC.PRG is only for Modem2 and Serial2 on a TT because the SCC chip is
attached to these two communication ports on the TT. The MFP chip is
attached to Modem1.
So it is not the port you look to, it is the chip attached to the port.
Your STe for example used to have a MFP chip attached to Modem1(your
only
serial port) but since the hardware has been upgraded you now have a SCC
chip connected to your Modem1 port, therefore you need to use the
SCC.PRG
now (or ESCC.PRG, I don't know your situation)

> not want to play...What am I doing wrong???

Short answer is, I don't know! Sounds a bit like Kevin's problem, where Connect worked but not STinG. If you can fax, then it looks like MPC is talking to the serial port OK. On the face of it, and I'm no expert, it looks like something to do with STinG's setup. Or possibly port settings not matching the PC's (which may not affect the fax side of things - ?). Working through the chain on my setup:

PC port settings in Device manager (should get overridden by software settings AIUI): 9600, 8-none-1, Xon/Xoff

Control panel/modems: COM3, Max speed 115200, 8-none-1

MagiC-PC serial port settings: 115200, COM3, Activated

Serial port settings (STinG serial.cpx): 115200, 8-none-1, RTS/CTS, buffers set to 256 (send and receive)

Can't be the init string for the modem if it's the same one you used with your STE.

If comparing yours to the above doesn't shed any light, I'd be happy to send you my STinG configs via email if you think it would be useful. Let me know.

Strange isn't it. On some machines Adamas seems to work while on others
like on my Hades is just like one piece of sh*t.
Believe me you and me aren't the only one who has troubles with Adamas.
However to be honest Adamas 1.7 is lots better than the previous version
but unfortunately not crash free.
For the moment Cab 2.8 is still the best browser we can get for the Atari.

: damaged? I know it wasnt in best condition before.

Good to hear I could help you out. The first suspect isn't the
SCSI cable, but you could test that easily by attaching the
cable without the hard drive. If the problem persist you have
found the faulty link.

However, I suspect that your SCSI drive is to blame. If you can,
try another drive. Also try your drive on another system. It is
possible that your drive will respond if you attach it
after you have booted up the rest of the system. This
means you'd have to, very carefully, put in your SCSI cable into
your Falcon while the computer is on. Then you'd turn the power
on for the SCSI and run HDDRIVER.PRG one more time, to reach it.
You can then, if all goes well, save your vital data and
possibly repartition or reformat your harddisk. Sometimes it
helps doing that on a PC or Mac first and then again on the
Atari. But don't blame me if something burns! If you're a
gambler you can do this, but if you like to play safe, get
another drive.

That's just reminded me about an identical problem a friend had with his Falcon and CAB 2.5. Upgrading the memory fixed the non-show of graphics in CAB immediately.

You could do it with a batch file, which if you can't get it to run at
bootup you could run every so often so you don't have to do it manually.

Thinking about it you could probably run it from MagiC's autoexec.bat:
worth experimenting!

I am not sure what you mean by "copy". Are you already an owner
of Cubase and just have some bad files, or are you needing to
buy it.

If you are already an owner I am happy to send you any files you
need via Email. I do not mind doing this considering that Cubase
is dongleware. This is not breaking their license agreements.

If you need to buy it check out http://www.atamusic.u-net.com/

Yikes! If something went wrong a damaged Falcon would result.
I've never tried this approach to data recovery, but if I were
going to, I'd get a "junk" computer to use as the sacrificial
lamb.

First off, let me note that I know nothing about Magic PC, so
I'm basically guessing here.
First of all, you can FAX. This means that the modem port is
O.K. (By the way, you ARE toggling the modem power switch after
FAXing to get back to regular mode?) Secondly, the DTR light is
staying on. In my pre-STing days the DTR light was essentially
a "computer on" light. Only now that I run STing does it stay
off. However, when I used to still call into BBSs, I had to
toggle the checkbox under STING.CPX. That effectively turned
off STing so I could modem the old fashioned way.

Give that a try. I suspect that either STing is not properly
configured, or some Windows program and STing are fighting. As
another idea, leave the modem off until just before you click
on "Enable". As a third idea, make sure you are not using that
port for anything Windows.

I'd possibly suggest using a CLI with a batch file.

Will MagiC's MCMD utility do the job?

Hi Galen,

A>Dennis, I'm still not clear why I need 800Mb for a 650Mb disk. Are the
A>files on HD larger than those written to the CD due to sector sizes or
A>something?
yes. If it was just one file, the place needed would be identical.
It's extreme if you have a huge number of very small files. Once, my
TeX drive used to have 65 MB totally with 45 MB used and 10 MB free,
so 45+10=65! So 1 MB may easily fit on a 650 MB CD ROM.

Try them and see. I have upgraded a couple of STes using 30 pin 1 meg
simms taken from old PCs, and found that they are sometimes a bit fussy
about the ram put in them. But a bit of trial and error and you'll sort
out a combination that works.

Hi Al

English isn't my first language but I'll answer anyway. I installed the
latest demo on my Milan (the milan version), and to my surprise it
worked directly, didn't disable Sting, worked regardless. But one
thing I did was that I didn't install the dialer accessory, used the
prg instead. As I said it worked straight away but was slow and it
still is missing a lot of HTML tags. Anyhow, do you have any specific
questions?

: Can it be DMA related? Since i cannot use floppy or scsi
: i cant really try any program.

It can. Go down to CT slow mode first. Try physically detaching
your harddisks and see if you can access the floppy alone. If
yes, it could mean that one of your harddisks is stalling the
DMA somehow. Maybe by not releasing a signal. This can happen
(because of negative logic) even if your harddisk is just
attached to the bus but not powered on.

I use a TOS 4.92 bootdisk which loads that TOS and completely
ignores NVRAM when I suspect there might be an even remotely TOS
or NVRAM related problem. Try that next if the floppy works.

Source record: 62996

Hi Peter,

:) I have no clue.

Performed installation.

Installed FPU (indexed properly)

Machine would not boot, FPU ran very hot. My Mighty Sonic runs the FPU at 50Mhz, and it is no where near as hot as the CT2 was. There is a problem here. FPU is a PLCC 40Mhz 68882.

Removed FPU

Machine booted in normal (French TOS) mode, IDE and Floppy works, but no mouse.

Verify keyboard-mouse patch/replace Afterburner/ reverify keyboard-mouse patch-all is ok-reinstall CT2-no mouse

Ok, used hot keys to access dekstop.

Tried to launch Turbo mode. No menu apears. If I am not mistaken, I got a blue screen, but no interface. Must reset to exit.

ST RAM card is Wizztronics w/ 32mb 60ns EDO SIMM

I think that whatever is wrong with the FPU circuit smoked some other areas of the board. Before I spend endless night working out whatever the problem is, mine or Centeks, I would prefer for Rodolphe to evaluate the card. Of course he needs to respond to my emails before this can occur. There was a time that I would have spent weeks on end to complete a project like this if I thought the mistake was mine, but I do not think that the case in this instance. I would send the card to another user with a working CT2 installation for inspection, but fear that this card might cause problems with their Falcon, and I would not want to be responsible in that event.

Thanks,

Mike

I know that XBOOT boot-manager has a built-in command processing.
So you can fill up reset-resistant RAM-disks intelligently and also
deletes files, folders etc.

Hello,
It was announced twice in the German mag STComputer. Once in an
Editorial (I think of STC November 99) and once in an article.
Suse would have bought 4 Hades 060 computer to port Suse Linux to the
Milan 060 (which wasn't yet available at that time)..

Cheers,
Dan

>
Described physically, my cable has five connectors, used as follows:

1. External Centronics-type unused
2. Internal 50-pin unused
3. Internal 50-pin Original Syquest 44Meg drive
4. Internal 50-pin ICD host adapter
5. External Centronics-type "new" Syquest 200Meg drive

The cable had to be used this way due to the physical layout of the components. Any other combination put undue strain on parts of the cable or the host adapter board. I assumed the drives at each end had to be terminated. I left the 44Meg drive alone except for changing cables, so it should still be terminated. The external 200Meg drive has a switch on the back to control termination, and this switch is set to "ON." I also did nothing to the host adapter except change the cable.

Thus far, the drives have been working flawlessly, though the 200Meg drive seems a bit slower than the 44Meg drive when using 44Meg carts. Also, the 44Meg carts take nearly twice as long to spin up in the external drive than the 200Meg carts. I suspect the difference may be due to the age of the carts, but I have nothing to base that on. It's nothing that isn't easy to live with, though.

> I hope this is it.

No luck on both counts. MAGXBOOT.PRG is the program that is installed in the AUTO folder to actually start Magic. APPLICAT.INF contains the desktop icons and related stuff. MAGX.INF should be in the root directory of your C: drive. There should also be a MAGIC.RAM file in the root directory of C:. The rest of the Magic stuff is in C:\GEMSYS in various directories.

If you just executed the INSTMAGC.PRG file on the installation disk and the boot drive ("Laufwerk:") was set correctly (most likely C), you should have gotten a good install. If you have Magic 6, there should be a file called BOOT.LOG in the root directory of your boot drive that might have a clue in it.

System Solutions in the UK still sell it for the Atari, PC and the Mac.
http://www.system-solutions.co.uk/cafe
If there's no link for it on the main page, go to the bottom of the page and
select price list. Now you just have to scroll through the list until you
find it.

4800. Does anyone know where I can get a *cheap* copy of Band in a Box?

Newsgroup: comp.sys.atari.st
Date: 2000-04-13 00:00:00 UTC
From: "andy68man =+)" <andy@pettersons.freeserve.co.uk>
Message-ID: <8d3ugjcee1@newsg2.svr.pol.co.uk>
Source record: 63183

It retails new at £68 but that's a little steep. I've bought an Atari ST with monitor and Notator for £100 so I was hoping to pick up Band in a Box second hand or something. Also does anyone know what type (and where the best place to buy them cheap(ok I'm poor) is) of hard drive to buy for an ST520? I only want a little one for storing my notator files on it.

Thanks in anticipation for your impending help,

andy68man =+)

4801. Another HD problem

Newsgroup: comp.sys.atari.st
Date: 2000-04-13 00:00:00 UTC
From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <38F5B65B.2E971EC5@siemens.at>
Source record: 63184

Hi,

since some guys said that 2GB partitions are dangerous I thought
about repartitioning my Falcon IDE harddisk. As a first step I
copied bigdos_f to the C:/AUTO. I didn't watch for the right
sequence which was a very stupid thing to do.
After reboot the system crashed and when I succeeded in deleting
bigdos I couldn't use the IDE HD anymore. When I tried partitioning
HDDRUTIL said first that it's a 200GB ! HD and abortet partitioning
(reason : missing root sector). After trying even to format the
HD (I know one should not do that with an IDE but things couldn't
get worse) which aborted too I gave up for the day.
Next day when I switched on my Falcon some wonder happened and I
could access (and save !) the data on the HD. Afterwards I
repartitioned it (without problems) and restored all data.

The problem that remains is that since then when I boot in normal
(slow) mode everything seems to work normal but when I boot in
CT2 turbo mode I get the message that no boot sector was found on
the IDE HD and the boot sector is read from the SCSI disk.

Could anybody tell me how to correct that ?

Thanks
Gerhard

P.S. : Yes, my CT2 really works now and not only with TOS but also
with MINT and N.AES 2.0, which perform quite impressive in
turbo mode :) Hopefully I can try GCC 2.8.1c in that
environment soon.

I purchased the CT2 out of curiosity. I already have an
AB/NOVA/Nemesis and Mighty Sonic/NOVA/Nemesis, both self installed and
which work flawlessly. The ONLY reason I purchased the unit was for the
additional RAM that Expose could utilize. My CT2 does have problems, and
it isn't with the installation. My sarcasm stems from Rodolphe failing
to answer even one of my several emails concerning this. I'm sure it
isn't an SMTP problem, as I get "info mails" on a regular basis from
him. I am NOT going to spend weeks trying to figure out what the
problems is, and would gladly ship the unit to him for inspection, if
only he were to acknowledge any correspondence.
I am aware that many users have a trouble free operation (as far as the
CT2 goes), but still I feel that the statement "a fully functional CT2"
is and oxymoron as the unit is not trouble free, which you can find
documented in usenet archives over the last couple of years.

4812. Hardware Address on a Reibl Card???

Newsgroup: comp.sys.atari.st
Date: 2000-04-13 00:00:00 UTC
From: Keith Scroggins <kws@saltmine.radix.net>
Message-ID: <8d50js$104$1@news1.Radix.Net>
Source record: 63195

How can I assign the hardware address to a Reibl card? Is there a program to do this, and if so, where might I find it?

I have a new battery
installed on the VME card itself, which is installed in a Mega STE. I had MiNT at one point running, which would see the card, but complain that it did not have a hardware address... Couldn't get it fixed then. Have since removed MiNT, and am now working with STing 1.22.

Probably going back to MiNT as soon as I get another hard drive, but in the mean time, I'd like to get the card running under STing.

Thanks for any help!

Keith

4813. FS: Atari ST motherboards, parts, accessories

Hello there..

These parts were recently donated to me and I don't have much use for
them.. if you're interested in any of these things, contact me... all
items tested and working unless noted!

1 Atari SC1224 monitor

1 Raven RP2406 dot matrix printer
1 Star NX-1000 dot matrix printer

2 Atari 520STFM motherboards (TOS 1.02)
1 Atari 1040STFM motherboard (TOS 1.04)

case top for 1040STE, 1/2" floppy drive opening
case bottom for STFM
case top/bottom for 520STFM, like new, 1/3" floppy drive opening
case top/bottom for 520STFM, 1/3" floppy drive opening

2 ST keyboards (working, good condition)
1 STe keyboard, lacking connecting cable and w/flaky mouse port.
(might as well use it for parts..)

All offers welcome; buyer pays shipping. Contact me through this NG or
via e-mail at macgod@rocketmail.com .

Cheers!
Derek

He tried to help me with my problems and when I gave up and shipped
him my mb he repaired it for 60 EUR. BTW, the problem was not
with the CT2. It worked for some time before I made some other
changes and ruined something by that.
But maybe he is more cooperative when he has installed the CT2 himself
like he did with mine ?

It normally comes delivered with the Reibl, which means you can
forward him a copy legally.

This is also what I used to fix my hardware address, after I put
a new battery in.

68882-33? Must be an 33Mhz type or better, other woni¿½t run well.

Point (Pin1) of top on PLCC FPU must have the direction to CPU / flat
cable connector on CT2 board. Isni¿½t normal that FPU goes hot.

FPU work on another falcon?

> Tried to launch Turbo mode. No menu apears. If I am not mistaken, I got
> a blue screen, but no interface. Must reset to exit.

Falcon in normal mode run well?
Original CPU allways present? You removed the hole cpu or is the cpu
disabled like the description out of the centek "manual" ?

> I think that whatever is wrong with the FPU circuit smoked some other
> areas of the board. Before I spend endless night working out whatever

Yep, isni¿½t normal.

> the problem is, mine or Centeks, I would prefer for Rodolphe to evaluate
> the card. Of course he needs to respond to my emails before this can
> occur. There was a time that I would have spent weeks on end to complete
> a project like this if I thought the mistake was mine, but I do not

Email answers are not often..
Looks desintressed.

All boards sell, thati¿½s enough ./

Main answers: (if you got one)

"Send falcon and CT2 board"
"We have to check your CT2 installing"

Not ONE word specialy about user question or to fit any problem.
Same as here.

> think that the case in this instance. I would send the card to anoth

Think the best way is to send board incl. CT2. He should gave an answer
about pricing, adress and how long the session is.

> user with a working CT2 installation for inspection, but fear that this

That can, but not must work. Not any CT2 run on any mainboard.

The point centek like to fit any CT2 to the mainboard..
and they tell anybody to use the fitting service.

As long all the time, i only saw 4 users they fit the ct2 board well at
home! Any other falcon was on the road to centek. (And was back without
the orignal cpu)

These points drive me to say that CT2 are fine and fast, but it isnï¿½t
developed for self fitting. Any falcon had his own problem.
Only spare falcons works fine after fitting.

Regards, Robert

Don't know about the docs but obviously it sells. Maybe with English
docs it would have to be more expensive.

: The ANS software (it was commercial, i. e. I can't send it to you)
: included software for doing this.

Hello,

Thanks for the response! I have a copy of the ANS software (I have 2
cards, and got it with them), but I have not been able to figure out which
program to run to set the hardware address. I've never been able to get
my 2 Mega STe's to talk to each other with the soft, but I guess I didn't
try too hard.

I was able to verify the cards worked with MintNet...

Which program on the ANS disk lets on config the hardware address, and
does the driver on the disk need to be run before the configuration
software is run, or not?

Thanks!

Keith

With modern SCSI utilities it's pretty much "plug in, turn on".
It MUST be SCSI, however. BTW, isn't the ZIP 250 SCSI/EParallel?

From: i4got@home.com
Message-ID: <38F7A928.7F388490@home.com>
Source record: 63027

Hello. I recently purchased a Mega ST 4 with Tos 1.02.
I've had a 1040ST for 13 years with a memory and Rom upgrade version 1.04. I read through some articles on the net and I thought that I could simply transfer the 6 chip TOS 1.04 from the 1040ST to the Mega4. WRONG! It didn't work. The Mega ST came with 2 chips in it but has 6 slots. I have no idea why this wouldn't work so I transfered everything back and all is fine, except I still would like to have TOS 1.04 on my mega ST in the form of ROM Chips. Is there a way to use the 6 chips that I have in the 1040 and if so, how? If not where can I get some new ROMS. I only paid $45.00 for my Mega 4 with mono and colour Monitors, a printer, Atari Modem and a megafile 30 and loads of software. I don't want to spend alot of money for the O/S upgrade and I plan on giving my 1040 to a friend. Any advise would be much appreciated.
Thanks!!!
R.J

To respond to this message, please use the enclosed link rather than your reply button.

Updated as of 04/14/00

I have a limited amount of brand new Atari Jaguar items for sale or trade. These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (all contain one controller, RF Box and AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $50
- Atari Jaguar with CyberMorph cartridge $40
- Atari Jaguar (No Cart) $30

** Atari Jaguar Accessories - New**
==========
- Jaguar unit alone (No power supply, controller or accessories) $20
- Team Tap (4 Player adapter) $30
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $15
- RF Switch Box $10

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========
All are in Mint Condition

- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for rare or shrink-wrapped/sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- A working Phillips or JVC 4000 series Dish Network receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard (should I be so lucky :).

Andy,
I picked up a Megafile30 on E-Bay (not sure if you can deal from the UK).
I believe you can hook up an SCSI drive but an adapter is needed (Link?).

Bonjour :)

The final version 1.47 of Joe is to come, but I have a big problem.
I have been reported that the kurzels do not work anymore. But I can't
see it, it works prefectly on my Atari machines.

The beta version is at http://www.multimania.com/nef/

Can you test the kurzel functionnalities and send me a bugreport?

Thanks.

Rajah

Interesting thing. On 'simple' ST's, there are jumpers for configure machine for usage with 2 or 6 ROM-chips. I have here one Mega ST, and I don't see any jumper (solder pad) for such purpose, although it has place for additional 4 ROM-chip. Maybe MMU chip is not same ? It's here C100109-001, while in 'simple' ST's is usually CO25912-38. Try to replace MMU chip too.

By 'simple' ST's you may find some kind 'solder pods' for set whether 2 or 6 ROM chip is used. There is also printed on board 256K A16(7) 1M . I have here one Mega ST, and I don't see such pods. There is only 2 short-connectable pod near to GLUE chip, bot nothing writes.
Maybe you should try to replace GLUE chip too, because it looks that it's not same - in Mega ST is C101643. 6 chip version in ST's is usually C025915-38.

IIRC you may have to set a couple of jumpers to tell it that you are using 6 chips instead of 2, and these are grouped into banks for 3 (3 x hi & 3 x lo).

From: i4got@home.com
Message-ID: <38F842A0.DB9B7D98@home.com>
Source record: 63046

Hello. Thanks for your info. I opened my 1040ST and could not find anything that started with An A. This made me think a bit. So I whipped out my Mega ST Schematics and opened the MegaST and found what I believe to be the solution. This is what the Schematic said:
ROM TABLE IC ; U12 (74LS11)
Jumper ; W2,W3,W4

ROM Location
W2 W3 W4 U12
256K 1 - 2 1 - 2 Jumper No Use
1M X2 2 - 3 2 - 3 Non Use
1M X6 2 - 3 2 -3 Jumper No Use

```
-------------------------------------
|
U24 0 U12 |
|::::::::| | | |::::::::| | 0 = Jumper locations
Open
0 W2 W3 | * = Jumper Locations Closed(Soldered)
W4 0** 0** | Resistors are required. W2 and W3 use
resistors.
123 123 |
-------------------------------------|
```

The above diagram is located @ the front bottom left of the Mega ST in the corner. This is easily located by ICs U24 and U12 side by side. To the right of the ICs is a large square IC marked U30.

According to the schematics, in the MegaST with 2 chips(1 meg), the Jumpers are set by defualt as Jumper W2 in position 2-3, Jumper W3 in position 2-3, Jumper W4 isn't used and the IC U12 is used. This is the standard factory setting. For me to use the 6 chips(the
Eproms from my 1040ST, I need set the jumpers as such for the 6 chip 256k selection:
W2 = position 1-2, W3 = position 1-2, W4 = Jumper and IC U12 needs to be removed. This is if the chips from the 1040ST are 256K which I believe they are.
W2 W3 and W4 are jumpers. They are jumpered with resisters. W2 and W3 are a tan coloured resister with 1 black stripe around them. That's all. W4 doesn't exist with the factory settings. I can remove the IC but I need to put a resistor in the W4 position. I don't know what the resistor value should be. Theoretically, it would be the same as the other 2 but that is just guessing. The removal of the IC might also be a bit of fun but with the solder sucker and the braze I shouldn't have much trouble. The resistor is the only real thing in question here.
If anyone can confirm what I am suggesting and let me know anything regarding

the resistor and the IC removal, please let me know. Thanks alot.
The roms can be bought here:
http://www.best-electronics-ca.com/custom-i.htm
and according to their listing, I don't see a 6 chip - 1 meg setup. They do
sell 6 chip sets but I believe they are 256k. I don't know what EPROMS I have.
How can I tell if they are 256k or 1 meg?
Any help would be greatly appreciated. Thanks

Please email:
i4got@home.com

From: Joakim H&#65533;gberg <gokmase@my-deja.com>
Message-ID: <8d9jsp$t68$1@nnrp1.deja.com>
Source record: 63048

Hi all,

I felt it was time to update the icon library once again and here is a
list of what is added:

49 Boardgame icons
28 Grocery icons
25 Coffee icons
24 South Park Icons
22 Smurf Icons

Total 148 new icons!

All converted by Dieter Junius and me.
Have fun with these, and please send any feedback or
suggestions you might have,

/Joakim

Hi Paul,

"Paul Mac" <paul_mc@atariste.freeserve.co.uk> wrote in message
news:8d4gt5kkb1@newsg2.svr.pol.co.uk...
> hiya..
>
> this batch file idea sounds good.. but you'll have to explain what on
> is first :)

A batch file is a list (batch) of commands to be executed by a command line interface (CLI). This is really DOS terminology: the Unix equivalent are shell scripts (if I'm wrong on this someone is bound to correct me!). You can get complex with these and start using them like a programming language, but for simple use they tend to be quite obvious once you know the basic commands. They are very useful for running text-based programs with pre-set command lines (rather than typing in complex command line arguments each time). I used to use them in this way in conjunction with Okami's offline utilities to do filtering and download selected articles after viewing headers, for example (it does it internally now, I believe): the utilities would take quite complex command lines. For an example, see:

http://www.whalley.demon.co.uk/atari/texts/selokami.html

MagiC comes with a CLI called MCMD (so you have one already), which generally runs in a VT52 terminal window as with other text-based programs under MagiC. As with any other CLI you can use it interactively by typing commands at a prompt, and a batch file in its simple form is the equivalent of typing in several commands one after the other.

I'm not an expert, though, so I'll point you in the direction of the MagiC Documentation Project (which is a translation into English of the full German programming docs):

http://www.whalley.demon.co.uk/atari/mdp/

This includes a file in 1stWord format called CMD.1WP which will tell you everything you ever wanted to know about MCMD and some (you should have a German version called CMD.DOC lurking on your HD already as it comes with MagiC)! Be warned, though, that this document is quite old (it started out as the docs for older versions of what is now MCMD which came with Kaos etc).

In your case for the job in hand you probably need to know about changing directories (folders) and deleting files using patterns, and read the bit about running it from the auto folder.

NB the autoexec.bat referred to in the docs isn't the same as the autoexec.bat in your MagiC auto folder (which is a later idea). If you run MCMD from the auto folder it looks for c:\boot.bat anyway (if I've read the docs right - no guarantee!).

Anyway, I'd suggest running the batch file manually (you can double-click them if you are using Magxdesk with its default settings, or associate them with MCMD is using a replacement desktop) until you are happy that it's doing what it should, then move/rename or whatever when you configure it to run at bootup.

Be careful, though: you're going to be deleting stuff with it, so make sure you are deleting what you *mean* to delete and not something vital!

You have been warned (ie I'm taking no responsibility if you delete half the contents of your hard drive by accident)!

> Decided that this is a good as an excuse as any to dust of that copy
> of GFA!

Overkill, I'd say. A few lines similar to:

del c:\folder*.log

etc look like a simpler solution. BTW the above should delete all files with a .log extension in a folder called "folder" in the root of your C drive. There is an optional switch to make it do it without asking if you mean it (not sure if this is necessary if running from a batch file) - see docs.

See what I mean about being fairly straightforward?

HTH
John

Right, I see those parts in Mega ST here (I don't have schematic of it).

I think that removal of IC U12 is not necessary. Resistor value is not
problem - you can put there anything between shortcut and 33 ohm.

Atari ST (not Mega) doesn't support 6 x 1Mb ROM . So, if you took that
chips from 1040, it's certainly 256K.
Standard 256K EPROM's have sign ..27256... , but Atari used own marks on
chips.

Hi,
My friend (from out of town) uses a 1040Ste with cubase - he would like to set it up so he can send me over his arrangement files through e-mail to my PC win98.
Can somebody indicate me a way of doing that ?
I guess we need to plug a modem to the modem port of the atari and use a dial-up connection, what kind of modem can I use , do I need extra software ?

Thanks
Jac

That's my litle secret: -))
Now seriously, it's on the homepage of the author
http://home.ins.de/home/dieter.fiebelkorn/

>Does anyone know what's new vs 3.17 cause it's not in the docs ?

I don't know but one of the changes is that Gemview is not longer payware.
It still needs a key but you can get it for free from the author. IIRC
that and other things are explained in his homepage.

Hi Mike!

(please excuse my strange interpretation of the english language, but your swedish is probably a lot worse :-)

OK.. Tricky problem.. Are you sure you have drawn the wires in the sockets where the PLDs used to be correctly? Are the wires on the ct2-connector drawn the right way (could be upside down)? (The fitting instructions is A BIT tricky to follow.. It does not really say which way you should do this)

...32MB ST-RAM?.. How is this possible? Isn't the F030 limited to 16 (14)mb?
and EDO?.. I use my original atari 4mb card, modified with 60ns fastpage
chips. Perhaps you should try Fastpage memory instead of EDO? (I've heard
EDO does not allways work as ST-RAM)

What kind of FAST-RAM are you using? I think it has to be 60ns EDO in order to work..

btw You have a 40mhz FPU as PLCC? Lucky bastard, these are impossible to find above 33mhz.. Wish I could find a faster one so I could clock it even higher (Like 80mhz or something)

Cheers!

/Peter Persson / HMS Fieldbus Systems

Doesn't System 7 require a minimum of 4MB RAM? and recommends twice as
much? Maybe a standard ST simply does not have enough RAM for System 7?

>simply transfer the 6 chip TOS 1.04 from the 1040ST to the Mega4. WRONG!
>It didn't work.

The board has to be re-configured. Somewhere in the forward-left corner
of a Mega's board there should be solder pads for jumpers, named W2 and
W3. They should be connected otherwise. Nearby, a jumper named W4
should be connected (about 20mm piece of wire is needed). This connects
input pin 2 of U12 (a 74LS11) with a line going from output of pin 12 of
the same chip. And a trace has to be cut on the board- the output of U12 on
pin 12 is no longer needed. Jumper W4 replaces the output signal from U12
with the signal that is input on pin 2 of the same chip. This is the
"ROM2" signal. And all the above is valid is assuming that TOS1.04 is in
256kbit EPROMs.

Therefore:

ROM W2 W3 W4 U12

6x 256kbit 1-2 1-2 no not used <-- this is what you want
6x 1Mbit 2-3 2-3 yes not used
2x 1Mbit 2-3 2-3 no used

You will probably have to reconfigure the 1040ST too,
this time for two chips, if you intend to put Mega's TOS in it.

Btw. with a little hardware-hacking and a couple of additional chips on a
little board, a much-better TOS2.06 can be installed in two EPROMs in
a Mega.

From: i4got@home.com
Message-ID: <38F9DA3E.FF17BE76@home.com>
Source record: 63068

Hello. Thanks for your help. After I looked at the MegaST Schematics last night I had 2 questions. 1. Could I simply remove the IC marked U12 and solder in Jumper 4 to compplete the upgrade? The reason why I'm suggesting this is because the MegaST schematic says that the IC marked U12 is not used for the configuration with the 256K 6 chip setup and also, the IC could be put back if I switched to 2 chips later. If remove a trace, I'll have to connect the path via a wire later on. The 2nd question regarding the resistor like jumpers was what is this resistor like object? It was tanned coloured with only 1 black stripe. I've never seen this before. W2 and W3 are like this. I guess since black represents 0 and there are no more bands, there is no resistance. I don't understand why they just didn't use a regular wire. Asthetics I guess.
I have a few more questions. This MegaST that I just bought has a socket soldered on top of the 68000 chip. They didn't come like that did they? What could the function of that be? Do you know of any upgrades regarding this extra hardware?
The last thing, is that when I hooked my MegaST up to the hard drive that my 1040st was using, Neodesk wouldn't load. After reading the book, I realized that TOS 1.02 was in the mega and 1.02 didn't support autobooting, 1.04 did. This is one of the reasons why I wan't 10.4. Anyway, while using the mega, I was copying some files around and there was a 10-15 sec. delay when copying files before the file would start to copy. I verified this by watching the hard drive LEDs. There was even 1 file that I copied to the autofolder and tried to delete it but I was denied access to it. When I unplugged the megaST and plugged the 1040ST back in, I deleted that file that wouldn't delete and then copied that files back where they originally were. This was instantaneous like it's supposed to be. Do the 2 problems that I mentioned occur normally with Tos 1.02?
Lastly, I wouldn't mind having a better TOS but I don't want to spend any extra money on the system. I was doing great my my 1040ST until a friend wanted to buy an ST for music sequencing. I found the Mega4 with the Megafile30,printer,Atari modem, colour and mono monitor, joystick, aB switcher, Internal and external floppy, Manuals and loads of software(Lots of original with manuals) all for $45.00 Canadian!! I figured, screw this, I'll take the MegaST for myself and give the 1040 with the mono monitor to my friend. After booting the MegaST with the hard drive, then I realized to TOS had to be upgraded which brought me here.
Thanks alot for your help. I love newsgroups. There's always knowlegeable people all over the world willing to offer help and advice. That's great!!
1 more question, what is the advantage of TOS 2.06 and where can I get a hold of that if I decided to do so in ther future?
In response to reconfiguring the 1040, I have a spare 1040ST with TOS 1.0 in it. I'm going to put that TOS in 1040ST that I give to my friend.
Thanks again!!
R.J.

7.0 and 7.0.1 will run in 2MB. I've done it.

7.5 might require 4, though.

7.5 needs 3 or 4 IIRC. I know a friend who runs 7.5 on his 4MB Mac SE, but.. well, that's an SE (bigger, newer ROMs) and it's dreadfully slow.

Hi everyone!

Last year the external harddisk of my atari 1040 st crashed. Few weeks later
a fire destroyed my Atari. lucky me, I found a new one.
But I can't get a connection to the harddisk anymore and I have no utilities
to fixe the problem.
Is it possible to mount the harddrive into my PC and emulate the Atari??
Probably there's something wrong with the FAT's so I have to repair that
too. It is known to be possible reading 1040st files into the PC. Anyone
who can help me???????

thanks in advance

DJ

No, it will run in as little as 2. The Powerbook 100 shipped with 2 meg
of RAM and System 7.

There is a hard/software Atari and Mac emulator for the PC called Gemulator.
The website is something like "Emulators Online" or some such. It's supposed to
work pretty well...

I'm not sure, if so does that mean I would simply need an SCSI cable to
link it via the through port on the hard drive?

Those are zero ohm "resistors" - that is: jumpers which look fancier than a
straight-forward component leg, but with exactly the same function... ;)

Last Updated 04/16/00
- Sold Items removed

I have the following Atari ST components, software and manuals/magazines for sale. All the equipment is cleaned and detailed, and in good or better condition, but without boxes unless noted. If you have any questions in regards to unit condition, please feel free to ask.

All prices quoted are in U.S. funds with the buyer paying shipping. For items that I am taking offers on (no price listed), please make all offers in U.S. funds. I am also willing to trade for certain items, please see my list at the end of this post.

If you are interested in any of these items, please respond to Jim at jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.ST (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

Hardware Please make an offer
==========
- Atari 520 ST - with mouse but missing power supply (fully functional)
- Atari Mega4 ST - Boxed with keyboards/mouse/power supply - possible deal pending
- Atari SC1224 Monitor 13" ST Color Monitor
- Atari PCT1426 Monitor 14" High Resolution TT/PC Color Monitor - possible deal pending
- Viking 1280 x 960 20" Monochrome TT Monitor - Boxed
- Atari SF354 3.5" Floppy Drive - with drive cable, no power supply
- Atari SLM804 Laser Printer - boxed with power supply and Laser Printer Controller
- Atari Megafile 44 with built-in Tape Backup - with power supply and cable
- Atari Megafile 60(s) - with power supply (two units left)
- Magic Sac 1 - Macintosh Emulator Cartridge (with manuals, but NO ROMS)
- Magic Sac 1+ - Macintosh Emulator Cartridge (with manuals and ROMS)
- Custom made Atari RGB/Audio cable. Connects an Atari ST to either a SONY XBR or XBR II RGB Monitor
- Best Data Smart One 2400X - 2400 baud modem

Controllers Please make an offer
==========

- Paddles (multiple sets) - for Atari & Commodore units
- 2x Suncom Tac Joysticks - for Atari & Commodore units
- 1x Spectravideo Joystick with suction cup base - for Atari & Commodore units

ST Software Please make an offer
==========
- UltraScript for MEGA ST- by Atari (with manual & software)
- Ultra Script Type Collection - Packages 1-7 (Complete with box, manuals, & software)
- Macro Mouse - The mouse recorder (Complete with packaging, manuals, & software)
- Calamus Desktop Publishing (Complete with box, manuals, & software)
- Spectre GCR Mac Emulator with ver. 3.0 update manual (Box, manuals, software - NO ROMS or cartridge)
- Flash Telecommunications package (Complete with packaging, manuals, & software)
- Flash II Telecommunications package (with manual and software)
- Dungeon Master - by FTL (Complete with box, manuals, & software)

ST Books Please make an offer
==========
- Atari ST Volume One VDI
- Atari ST Volume Two AES
- Atari ST GEM Programmers Reference
- Atari ST Tips & Tricks
- Atari ST Internals
- Programmers Guide to GEM
- MC68040 32-Bit Microprocessor Users Manual - by Motorola
- MC68000 8/16/32-Bit Microprocessor Users Manual (eighth edition) - by Motorola

Manuals & Technical Guides (software status specified) Please make an offer
==========
The majority of the ST/TT manuals are of the binder variety
- Micro C Shell - by Beckemeyer Development Tools (without software)
- LDW Power Spreadsheet - by Logical Design Works (without software)
- Superbase Personal - by Precision Software (without software)
- dBMan - by Atari (without software)
- 1st Word Plus - by Electric Distribution (without software)
- HyperPaint - by Atari (without software)
- Easy Draw - by Migraph (without software)
- Regent Base/ Regent Base 2 - by Regent (without software)
- Publishing Partner Professional / PageStream -by Soft Logic (without software)
- Publishing Partner - by Soft Logic (without software)
- Touch-Up - by Migraph (without software)
- Microsoft Write - by Atari (without software)
- Codekeys The Macro Tool - by CodeHead Software (without software)
- Degas Elite - by Integral Solutions (without software)

- Brataccas - by Psygnosis (without software)

Atari Force Comics Please make an offer
==========
All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for or towards rare or shrink-wrapped/sealed
titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- A working first generation Dish Network receiver
- A working Phillips or JVC 4000 series Dish Network receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard (should I
be so lucky :)

:) I don't remember what I said, but the Wizztronics ST RAM card has a 16mb 60ns EDO simm that works well with the Nemesis, Mighty Sonic and Afterburner. The CT2 had a 32mb 60ns EDO simm during the installation. I tried several types of simms, and figure that the Toshibas were of pretty high quality.

> higher (Like 80mhz or something)

You can clock the FPU faster, but it spits and sputters quite a bit
under bench test and accuracy testing. Under TOS this isn't a problem,
especially for rendering, but under MiNT it is a Nightmare! MiNT will
not tolerate even the slightest of CO-PRO errors and haults the system.
That is using the Falcon bus, maybe the CT2 would be better behaved. I
got the 40mhz PLCC from Sonnett in the US. They manufacture cards for
Macs. It was about $110.00 several years ago.

Have you tried a non EDO simm for ST-Ram?
The CT2 replaces the busemulation completely, perhaps it does not like EDO
simms?
I would try a non EDO SIMM for the ST-ram (I�ve had some problems with EDO
simms in some musical equipment designed for FP memorychips)

```
Good luck!

This was one theory I had. I had an Atari TT running Spectre 3.0, and
tried running system 7.1 and got the memory error. I wondered if having more
ST ram would have helped. Anyone with a TT with more than 4 megs of ram that
would like to test this theory, simply write me at:

drclu@swbell.net

There are a few other possibilities. In Dave Small's newsletter "Gadgets
News-Herald" number #4, we see some of the early thoughts about what could
cause the trouble with an ST emulating System 7:

Page 12
"System 7
Some not-quite-informed folks insist that Spectre can't work with Apple's
much-ballyhoed System 7, since the St hjas no MMU chip.

System 7's specs specifically say that any Mac Plus with 2 meg or more of RAM
will work with System 7, although virtual memory features will probably be
disabled. VM is just one small slice of sys 7.

Since we emulate a Plus, it is likely that if you're got 2 or more megs of RAM,
System 7 will work okay. Oh, sure, there might be the usual one-bug-fix (like
we saw with Sys 6.0.3), but we're not expecting a complate can't-work."

Issue 5 Page 12 he adds...

"will System 7 work? We believe so. Many people think that because the ST
does not have an "MMU" chip it cannot run System 7. Well, Apple specifically
says that System 7 can run on a Mac Plus with at least 2 megs of memory, and a
Mac Plus has no MMU! A "Memory Management Unit" (MMU) chip is specifically not
required for most of System 7 to basically work or for many of its features;
it's only needed for virtual momery (VM) and in later versions for process
proection. Anyway, this means there is an excellent chance Spectre will work
just fine on System 7, and if not, I imagine we'll hustle a new bug-fix release

of Spectre out the door. System 7, by the way, has been delayed (again!) until sometime in 1991.

There you have the latest of my information. Seems Dave had much the thinking I had, and where he got tied up is the mystery I'm trying to solve. It's basically a Mac Plus.. where were the differences? Why won't it work?

Was it memory? Was it a simple bug?

Has someone already made the hack to make this work? I've heard that up to system 8 has been used. I believe it is possible.

One thing I haven't tried.. what if a later version of System 7 would work over a earlier version? The earlier versions gave even a Macintosh trouble. Perhaps a later more reliable version would stand a better chance.

Gotta love it, anyway, keep the input flowing as we try to "push the envelope" ;)

This was one theory I had. I had an Atari TT running Spectre 3.0, and
tried running system 7.1 and got the memory error. I wondered if having more
ST ram would have helped. Anyone with a TT with more than 4 megs of ram that
would like to test this theory, simply write me at:

drclu@swbell.net

There are a few other possibilities. In Dave Small's newsletter "Gadgets
News-Herald" number #4, we see some of the early thoughts about what could
cause the trouble with an ST emulating System 7:

Page 12
"System 7
Some not-quite-informed folks insist that Spectre can't work with Apple's
much-ballyhoed System 7, since the St hjas no MMU chip.

System 7's specs specifically say that any Mac Plus with 2 meg or more of RAM
will work with System 7, although virtual memory features will probably be
disabled. VM is just one small slice of sys 7.

Since we emulate a Plus, it is likely that if you're got 2 or more megs of RAM,
System 7 will work okay. Oh, sure, there might be the usual one-bug-fix (like
we saw with Sys 6.0.3), but we're not expecting a complate can't-work."

Issue 5 Page 12 he adds...

"will System 7 work? We believe so. Many people think that because the ST
does not have an "MMU" chip it cannot run System 7. Well, Apple specifically
says that System 7 can run on a Mac Plus with at least 2 megs of memory, and a
Mac Plus has no MMU! A "Memory Management Unit" (MMU) chip is specifically not
required for most of System 7 to basically work or for many of its features;
it's only needed for virtual momery (VM) and in later versions for process
proection. Anyway, this means there is an excellent chance Spectre will work
just fine on System 7, and if not, I imagine we'll hustle a new bug-fix release

of Spectre out the door. System 7, by the way, has been delayed (again!) until sometime in 1991.

There you have the latest of my information. Seems Dave had much the thinking I had, and where he got tied up is the mystery I'm trying to solve. It's basically a Mac Plus.. where were the differences? Why won't it work?

Was it memory? Was it a simple bug?

Has someone already made the hack to make this work? I've heard that up to system 8 has been used. I believe it is possible.

One thing I haven't tried.. what if a later version of System 7 would work over a earlier version? The earlier versions gave even a Macintosh trouble. Perhaps a later more reliable version would stand a better chance.

Gotta love it, anyway, keep the input flowing as we try to "push the envelope" ;)

NO !! ASH doesn't accept credit cards. Living in the States your only
option is to send German DM banknotes with registered mail. Perhaps a
traveller cheque might to the trick as well, but then you better get in
touch with ASH first.

>I'm sure CAB 2.8 will eventually show up in the US though. Jim Collins

>like this.
According to a report in the German STC magazine a couple of months ago
SuSE is working on a port of Linux exclusively for the Milan II. But
then off course it wouldn't be the first time that STC comes with a
"scoop" that is based on "hot air"...

Hi Steven,

>OK Guys, Brown is close to chit, And beige is close to...Di@#$#@a; well
>let's just say that beige RUNS!
>
>SO why doesn't Magic Beige & CAB RUN?
I've missed the start of this thread.... assuming you're using IConnect
then make sure that AUTOSTIP is installed in the auto folder, STIP.PRG must
be put in the PPP folder and on the Mac side MacSTIP must be installed.
Also don't forget to set the "via MacOS" flag in the IConfig dialogbox in
the righthand top corner.

If it still doesn't run, perhaps it's because CAB only runs properly on
grey and creamy coloured computers with a fuji logo.... ;-)

According to the German MagiC manual, NVDI needs to be installed to run
MGNOTICE, MGEDIT ...etc. So you'll have to make sure that NVDI is placed
just behind magxboot.prg in the auto folder, and like Steve Sweet already
mentioned these applications need WDialog as well...

<snip>
Viele Programme (darunter MGEDIT und MGNOTICE) beni¿½tigen NVDI,

4902. magic mac 6 on mac quadra?

Newsgroup: comp.sys.atari.st
Date: 2000-04-17 00:00:00 UTC
From: Wanadoo <fmunniksma@wanadoo.nl>
Message-ID: <38fb69a8$0$27202@reader1.casema.net>
Source record: 63098

Hello everyone,

recently i read the ASH page on magic mac. It said that on older macs magic mac would not be an emulator program since it would run on the processor family (M680X0) it was meant for originally. So there would be no need to translate m68k instructions to ppc instructions. I looked at some specs of older macs, such as the Quadra's who feature a 68040 processor at 66 Mhz, often with built-in FPU, at least 500 Mb HD, CD rom etc.
Has anyone out there tried to run magic mac 6 on one of these older macs? It would be a dirt cheap way to run magic fast, a lot cheaper than running magic PC or magic milan...

greetings Freek Munniksma.

Of course you can remove the chip- but it may happen that you will remove
more than you want- the traces on the board are quite fragile. I think it
is easier and more reliable to make a little cut on one trace than to
desolder a DIL14 package. If you look at the schematics, you will see that
only one gate out of three on this chip is used, and you just have to
disable its output and replace it by signal from W4 (don't forget W2 and W3).

>The 2nd question regarding the resistor like jumpers
>was what is this resistor like object? It was tanned coloured with

You are about right: a zero-ohm-resistor=jumper ... why? who knows...
Btw. my computer had wire jumpers when I bought it.

Hi,
I have a 4MB MegaSTE for sale.
I also have the a 500MB SCSI Drive with the internal
SCSI adapter, but the existing case doesn't have
room to support it. It needs to be modified a bit.
However, it can be done.
I also have an ICD Link for exernal devices.

All, for $85 USD, OBO.

If interested, please call me at

Yes, I am doing it right now. This is written/send by ASH-
Emailer running in MagiCMac 6.01, on a Centris 660 AV.
All ASH internet programs run just fine, FIFI, Cab and Emailer.

cheers

Joergen

Hi all,

I just wondered if there is anyone using ISDN with their Atari - or rather Hades ? If so, which adapter(s) do you recommend ?

BT (in the UK) have a half-price offer for conversion at the moment and I am tempted to give it a go. Unfortunately, the only people I have spoken to so far have had some difficulty getting it set up properly - and that was on PC's !

Thanks in advance,

Paul

FWIW, I run 7.5.5 on my PowerBook 100 (about the same as the SE) and
performance is better than it was with 7.0 or 7.1.

(Now if there was a way to get a 68030 into my PB100!)

Hi M.

>I appear to be missing the magx.inf, magic.ram and the instmagc.prg.I've been trying to
>run magic 5 without them.Thanks for all your help.

Instmagic.prg will be on the installation disk, magic.ram should be in the root of C:\,
if its not then MAGXBOOT will return you to TOS.

You should still be able to run MAGIC without a magx.inf file, this will be created
after MAGXDESK whinges that it cant find said file and that it will use defaults.

I can't comment on the zip but with my Syquest cartridges I format them using HDriver and the option TOS DOS compatibility. However, you are restricted to 1 partition. I also have a PC with a scsi card and the cartridge works fine in both machines.

Hope this helps

>I've checked through my disks and I'm missing the needed files for
>Magic installation. Is there any place I could pick them up?
???
NO, there's only one way to install MagiC. Use the setup program, enter
your name and serialnumber. Select the correct paths and click on OK.
That's all there is to it.
When the installation is finished all the necessary files will be
installed. The only file that might need to be edited is MAGX.INF which
is placed in the root directory of C, you might like to set the ENV
paths in that file .If you don't have a clue what I'm talking about, use
the MagiC Configuration program which comes with the installation to
edit MAGX.INF. That file can be located in GEMSYS/MAGIC/UTILS.
Also make sure that in the GEMSYS folder there is a HOME folder, if not
then create it....

Cheers from Belgium

The format is not important, only the way the media were partitioned.
HDDRIVER provides several means for creating media suitable for Atari
and PC. The manual gives more information on that. Usually the TOS/DOS
compatible format is the best.

Not specifically for TOS machines, no... but an awful lot of external
ISDN terminal adapters are just serial devices, are they not?

Grab a 3Com ImpactIQ (or USR Courier ISDN or whathaveyou), plug it into
the serial ports and dial..

Doing multilink PPP might be more of a challenge.. but nothing the
STiNG developer community couldn't handle, I'm sure. :)

Cheers!

Four megs... I got a 14.4 modem and 80 mb hard drive from
www.powerbookguy.com, and use the PB100 whenever I travel.

If your free PB100 doesn't have at least 4 megs, I would just put System
6.0.8 on it.

I only have Magic 1.2.5 (I think that's it) running on a Mac IIfx.
However before that I originally ran it on a Quadra 950 / 56 megs ram
and it used to go great. Having said that, it goes pretty good on the
II fx also.

I have recently looked at updating, but for the amount times I run
magicMac now I don't think it's worth the cost (for me that is).

Oops, what does that mean? They are not produced anymore or sold out?

I operated successfully an Elsa ISDN/Tl pro at Serial 2 of my Atari TT, it worked with MagiC/STinG and Debian Linux. I guess, you only have to make sure that it understands Hayes code commands ("AT"). If they are not available new, there should be a possiblity to get one second hand.

Regards,

Kerstin

4929. TT DH floppy TOS question

Newsgroup: comp.sys.atari.st
Date: 2000-04-18 00:00:00 UTC
From: Alyre Chiasson <epinoche@nbnet.nb.ca>
Message-ID: <38FC46EB.14A97F59@nbnet.nb.ca>
Source record: 63125

I was given what was probably one of the first TTs made. It came with a 40MEG hard drive and a 720K floppy drive. I've upgraded the hard drive to 120MEG and put in a 1.4 MEG floppy drive and flipped dip switch 7. It reads 1.4 floppies just fine and I see the HD format option under TOS. However, I cannot select the HD option. I suspect I have TOS 3.0 and maybe it doesn't support HD formatting? The other thing I found strange is no Atari logo comes up or memory check when the machine boots like my Mega Ste. Also I thought it was bad in general to bend especially SCSI cables, looked like an accordion in the TT I got.

Thanks

Alyre

4930. TT LAN Port with STinG

Newsgroup: comp.sys.atari.st

You can run TCP/IP over LAN (RS422), but your Fallaron adapter
isn't worth much without drivers.

> when I try and set Sting to use the LAN port it tells me
> "Failed to Activate Serial 2/LAN port"... And my SERIAL.CPX
> won't hold the LAN Port as ACTIVE...

LAN is selected by default, upon bootup. Unless you changed your
HS-Modem's SCC.PRG settings to use Serial2 instead.

Source record: 63130

Thanks to all the people that posted with help. So I finally got around to hooking the HD up to my computer's SCSI card, and that works fine, it detects it and all and everything's cool. I'm pretty sure the Link 2 is getting powered, since its red light is on. I opened up the HD but I don't see any TERMPWR jumpers like people mentioned. Still none of the software, ICD's or otherwise seems to detect the adapter. So do I just have a busted adapter or is something else going on? Thanks in advance.

Actually, you know how it is better to format 720K floppies on a peecee and then shuttle files from your peecee to your Atari? Works the same with Zip disks. I can take my Zip cartridge to work, get the big files (MiNT archives, way too big for floppies), take it home, and use them on my ST running Bigdos. So Zip disks partitioned/formatted for Atari I use on my Atari, and Zip disks formatted for DOS (ie, right out of the box) I use for shuttling files.

Wasn't someone working on a TOS filesystem for Linux? Seems to me you ought to be able to read a TOS partition with Linux given the appropriate filesystem extension.

Yes. I think you'll find they are used because they can be handled
easily by automatic insertion machines, where wire jumpers would need
special handling.

Hi

Some hard drive don't have a termpwr jumper or setting (only ONE of mine
does or of 4). Also some hard disk drivers don't detect everything on the
bus EVEN though ther MAY detect it during an ID check.

One of my Pioneer 6x CD changers isn't detected by HDdriver, although it is
detected using ICD software and, more importantly, the CD software!!!!!

Also make sure your cables are good ones, this got be stuck for ages as I
had 2 bad cables and didn't know it (yep brand new ones).

I would think it would be possible depending on the options you chose when you formatted it under HDDriver. There is an option for DOS compatibility I believe.

Hi!

It is not possible to read Amiga _floppydiscs_ (due to floppycontroller
diffs) however, you can read an Amiga formatted harddrive with a driver for
MiNT.
There is a utility for the Amiga to read/write MSDOS floppies.

Good luck!

/Peter Persson

Hi,

I am using a DIVA ISDN modem on my Hades with no problems
and have tested on a friends Falcon with the same result (but slower speed).
I have tested with Sting and MintNET.

Get a ISDN modem with serial connection that supports standard
AT commands and configurable speed.

That MiNT driver is for HD's as far as I know and very, very old.
I'd be suprised if it read a floppy. I think your best bet would
be to have someone with an Amiga send the files to an Atari user
via ftp or e-mail and then make the disk that way.

From: Tim Conrardy <tconrardy@hotmail.com>
Message-ID: <8dkdipgkr1@nnrp1.deja.com>
Source record: 63142

Hello All:
I have an unusual Question. Is there a utility that allows the Atari to read Amiga Discs? The reason I am asking is that Laurie Speigel of Music Mouse (she makes an Atari version as well)wants to make available the Amiga version as well, but does not have a way to read the disc so she can make a Zip out of it.

If there is no utility for for Atari, I wonder if there is one for Mac or PC (shudder)

I would really like to help Laurie here as she is continuing to make available the Atari version of Music Mouse (GREAT APP!!!)see my site (in sig)

Thanks in advance

Tim

HDDriver will allow the atari to read a PC formatted Zip disk. I have never had any luck getting a PC to read one that I formatted on my TT with PC compatability enabled. OTOH, I have no problem reading and writing to ones that I formatted on my PC (lhome or at work).

WinSTon is great for games, but TosBox and Gemulator are slightly better for serious work, as they can expand resolutions beyond those of the Atari.

> Does anyone know where I can download some of the old desktop accessories

Try any of the Atari FTP sites. URLs are in the Quick FAQ.

> and how to install them, I have forgotten.

Stick them in the root directory of your boot drive (A or C) and reboot. Max is 6 accessories.

> Also I have tried to use 1st Word Plus but have no idea how to get and
> install the appropriate printer driver for my HP DeskJet 720c, any help

I doubt this will work. There are no 1st Word drivers for the late HP DJ printers. Nobody uses 1st Word seriously anymore. Besides, does WinSTon emulate the printer port?

Tbis is strange. I do this all the time, and I know a lot of users doing
the same with Windows98/NT or Linux. Most likely you didn't specify the
correct BIOS parameters for your controller when partitioning the disk.
Please also refer to the HDDRIVER manual.

DJ
> printers.

There were drivers for early DeskJets, which might be OK for 1stWord as
it isn't doing high resolution or colour graphics. I don't *know* these
will work, though, as I don't have a DeskJet. I can lay hands on them:
drop me an email if you want them (NB warning in sig re mail address!).

If you are just salvaging stuff you did in 1stWord, then it may be
simpler to just convert the files. Have a look at this page on my web
site, particularly the link to WPLS2RTF - there is a DOS executable in
the archive which works under Win 98 in a DOS box:

On the market nowadays, there aren't any really viable options. It would be cheaper to buy a TT or a Falcon.

The Link-2 comes with its own 'ICD-Link Driver' I use 2 of them, one at
work and the other at home. They were plug and play I've never had a
problem.. You're using the DMA ASCI Port, have you checked the ASCI
drive number.??

I have no experience with this, but it shouldn't be a problem.

> Also, does anyone know where I can get a MegaST2 manual/website?

The original manual was useless. You'd be better off visiting the Quick FAQ.

> Three...using a Link2 to connect to SCSI HD...ICD software doesn't detect
> anything on the SCSI chain...any ideas? (new Link2...brand new!)

Is this an ICD Link ? If not, then you should forget the ICD Software. Use
AHDI (which is old, but free and in the Quick FAQ) or HD Driver, which is
much better but commercial.

Is Link2 adapter powered?
Is SCSI chain properly terminated? Unproper termination is a reason of
most problems with SCSI drives.

4981. Atari disks on PC

Newsgroup: comp.sys.atari.st
Date: 2000-04-21 00:00:00 UTC
From: Ian Numan <iannuman@netspace.net.au>
Message-ID: <390043B5.40A4CEA0@netspace.net.au>
Source record: 62977

I have an Atari STe with TOS 1.6, all my disks were formatted on it
which means that a PC should be able to read them.
Well, yes and no.
I have 2 PC's, one is an AMD K6-2 400, the other is a Pentium 90,
both are running Windows 95B, but only the Pentium 90 will read
all the Atari formatted disks, the K6-2 400 can read some disks OK,
while others can't be read properly.
Some disks log OK and report the correct bytes that are used/available,
but show no file names in Windows Explorer, while with others, it logs
the disk and reports incorrect bytes used/available, and shows the
file names as complete garbage.
Is this problem CPU related ?
Can Intel processors read Atari disks while AMD processors can't ?
Remember these disks were formatted on an STe with TOS 1.6, so they
don't suffer from the format/boot sector bug that earlier TOS's had.

I have a very nice system that I am reluctantly parting with. I would
prefer a buyer in the NY/NJ area, but shipping may be arranged.

1. 32 MHz TT in a German custom manufactured metal tower case.
2. 8 MB st ram
3. Aixtt TT Fastram card with 64 MB fast ram.
4. Nova Mach64 2mb DRAM graphics acellerator (very fast, does 1152x900
in
16bit, 1024x768 in 24bit)
5. 512MB SCSI HD
6. DEKA II PC-Keyboard interface unit. The system does not come with the

originl TT keyboard but with a nice PC keyboard and this interface.

A whole bunch of software.

I am looking for $750 or best offer.

I used to run Linux on this system but now am moving on to other hacking

projects.

Please e-mail me if intersted: scott@dmi.stevens-tech.edu

Mario is developing a graphics board for an st but i think it'll
probably included more than just a graphics card like new processor
and loads more memory. There is a DIY hardware project that allows an
st to connect to a ISA graphics card. Not sure how good it is though
but i'll have a go at it. Its in many ftp places and also on The
Atari Launchepad site. Its called ET4000. You could try lacescan but
its not that good (IMHO) but is very simple to make.(won't connect to
STe, only ST). Not sure where to get it from off the top off me head.

Not sure I can actually help with fixing the problem, but it *must* be
fixable as Texel is developed using MagiCMac, AFAIK.

I've certainly seen it demonstrated on Thomas Much's (the author of
Texel) Mac laptop at a show in the UK.

It's not a conflict with Auto or Acc programs is it? Or it's possible
you might need Wdialog installing if you are running a new Texel on a
MagiCMac which is the equivalent of MagiC 5. But I emphasise I'm
guessing here. Apologies if you've already tried these things.

Hi Charles,-

Well, Texel loads fine, but will not load any sheet, I have to wait a
few weeks till I get an new/old 200 Mhz. PPC.
Install MagiC and everything again.

cheers

Various people have had similar troubles, with the same sort of
inconsistencies, too. It seems to be machine-dependent rather than CPU
dependent.

I'm lucky in that most of the time my PC will read disks formatted on my
STE (TOS 1.62/MagiC 5), but occasionally weird things happen if you try
writing to them. This latter problem is due to Win 95/98/NT insisting on
writing stuff to the disk even if you only want to read it (I think it's
something to do with long filenames), which effectively knackers it back
on the Atari.

I'd therefore advise write-protecting Atari disks prior to inserting
them in the PC's drive, and when transferring files reformat the disks
on a frequent basis to get rid of any hidden nasties.

I just received a Mega ST4 and a bunch of Digital F/X equipment in
a portable mini rack. I have been able to deduce that it is a hard disk

recording system that has SMPTE capability.

Does anyone have any info on Digital F/X equipment?
It has teh name Digital EX Master on the front of three of
the units in teh mini rack.

Thanks,
David Baisley

```
No, it's more like motherboard or BIOS related.

For those tricky disks, try using GEM Explorer from http://www.emulators.com

The Mega ST itself doesn't have any audio capabilities. The only way to use it as a hard disk recording system is with Cubase Audio for the Yamaha CBX system. If you have a Yamaha CBX among the bits and bobs, then you're correct. If not, it was most probably a MIDI setup.

> Does anyone have any info on Digital F/X equipment?
> It has teh name Digital EX Master on the front of three of

Never heard of this. However, it could still have been used as a Midi System, the Atari driving a Midi synth, and the synth's output going through the F/X system, whatever it is.

Its defintiely not a midi system. The program itself even says its a hard disk recording system. The hardware has a connection to the Mega ST on the side and there is a harddrive connected to the back of the Mega ST.

I recorded nothing (I had nothign I could plug into the inputs) and it seemed to "record" it fine.

Thanks for the response though as it allows me to clarify one point. As you said the Mega ST does not have any audio capability. The audio ins and outs are on the Digital F/X unit.

Essentially the Mega ST 4 acts as the brains and interface to the to the device.

>Depending on the code, yes.

You might try GFA Basic in combination with Face Value to get a "VB like" environment. Works pretty much the same way. You don't have to program the gui, event handling etc yourself. Once you understand how it works it's very easy and fast to write GEM programs.

>Oh how we long for the simple to program Atari midi port.
>
><sigh>

Without third party add-ons the only way I could think of is to first create a byte-array with the actual MIDI data converted to MIDI-file format and save that. And then play the file with the "Media Player"! A typical Windows solution btw. Why can't anyone tell them MIDI is a simple serial port and include drivers for it within the Windows OS? :-)

4998. FS: TT + Nova Mach64 + Tower case followup...

Newsgroup: comp.sys.atari.st
Date: 2000-04-22 00:00:00 UTC
From: "Scott J. Kolodzieski" <scott@dmi.stevens-tech.edu>
Message-ID: <39019B36.B8D9D5F4@dmi.stevens-tech.edu>
Source record: 62897

I posted the following message on my TT that is for sale. I added some
more informtion for the interested buyer.

I have a very nice system that I am reluctantly parting with. I would
prefer a buyer in the NY/NJ area, but shipping may be arranged.

1. 32 MHz TT in a German custom manufactured metal tower case.
2. 8 MB st ram
3. Aixtt TT Fastram card with 64 MB fast ram.
4. Nova Mach64 2mb DRAM graphics acellerator (very fast, does 1152x900
in16bit, 1024x768 in 24bit)
5. 512MB SCSI HD
6. DEKA II PC-Keyboard interface unit. The system does not come with the
originl TT keyboard but with a nice PC keyboard and this interface.

A whole bunch of software.

I am looking for $750 or best offer.

I used to run Linux on this system but now am moving on to other hacking
projects.

Here is the new information:

It has GCC, emacs, and most FSF stuff installed on it for mint. As for
commercial software:

1. Lattice c 5.5 with manuals
2. APL 68000 Level II.
3. Atari Works
4. Word Flair
5. Word Up
6. hushi/scsi tools 6.x (i had a german friend buy this for me when she
was
in germany)
7. Speedo GDOS 5
8. Pagestream - excellent desktop publishing
9. Nova Driver disk

The nova drives any multisync, it is set up to do 320x200 up to
1280x1024,
all selectable at boot time. Of course the maximum number of colors is
given
by the resoultion and the fast it has 2mb ram on the graphics card.

I like 1152x900x16 since the that is the maximum resolution in 16bit
color.

There is some other software, but much of it is very old.

It is set to run tos/mint and linux, however I am keeping the linux disk
as
it is a 1.4gb external disk that I have some use for. I do need to go
through an clean the system software up a it and get some file off it.

Please e-mail me if intersted: scott@dmi.stevens-tech.edu

: don't suffer from the format/boot sector bug that earlier
TOS's had.

This seems to have more to do with individual diskdrives and
disk controllers on various PC systems than with the CPU brand.
Many times two PC:s can't even read their respective disks.

In my experience it is best to format the disks in MS-DOS
(type format /? to see the options). Ataris normally read both
DD and HD disks formatted on PC:s without problems.
Alternatively, if you don't have everyday access to a PC, you
could take one empty MS-DOS formatted disk and make an MSA image
of it. That way you could always recreate that image to new
disks.

Hi Paul,

>I just wondered if there is anyone using ISDN with their Atari - or
>rather Hades ? If so, which adapter(s) do you recommend ?
I used to have a ISDN line, but because of the riduculous prices that the
Belgian Phonecompany charged, I thrown it out... :-(
I'm really not sure what you mean with "adaptor". If it's the ISDN modem
that you a referring to then most of them will do the job. I used to have
a Elsa ISDN Pro which worked from the first time. Just make sure it has a
serial connection and a hayes compatible command set.

>Unfortunately, the only people I have spoken to so far have had some
>difficulty getting it set up properly - and that was on PC's !
Ahhh... but PC's are no reference, are they ? PC's are designed to make
life difficult..... :-)))
Using IConnect, I was able to connect to the ISP right from the very first
try, all that needs to be changed is the Pulse/Tone option to ISDN in the
dialup dialog of IConfig.. I've used serial2 set at 230000bps and also
increased the input/output buffers of HSModem to the maximum. On average
access times were between 11000 and 12000cps.
Logging in is much faster as well, in less then ten seconds the connection
to the ISP is established.

I noticed that the price of ISDN modems in the UK is quite high, have a
look at the German websites. Prices on average are 50% cheaper !!
http://www.alternate.de
http://www.PrimuxTronix.de
These shops deliver in less then a week worldwide, prices include VAT.

Cheers from Belgium
Dennis

Hello Jerry,

go to your Printer Configuration menu. I think it's on the drop down
menu on the far right, or one over to the far right. Once you click on
Printer Configuration, then when your in the Printer Configuration menu,
In that menu, their is a line underneath the Paper Size (By the way, you
may need to change the paper size to match A4). Enter in the line
"Special:" your paper type. On mine with a printer driver for my
LaserJet 6L I've tried on that line "Letter" and "Legal" and it works. I
haven't tried "A4" but it should work.

==Thanx==

5004. Re: Need a Replacement Printer

Newsgroup: comp.sys.atari.st
Date: 2000-04-22 00:00:00 UTC
From: Bravo Sierra Computers <bensmith@teleport.com>
Message-ID: <Pine.GSO.4.10.10004220815030.24669-100000@user2.teleport.com>
Source record: 62903

Hello Thomas,

From personal experience I recommend A Hewlett Packard Laser Jet. My Hewlett Packard LaserJet 6L will do 600 DPI on PageStream (an Calamus as well). Although I think you can get 600 DPI on a 5L and (I think 4?). The current PageStream has Drivers for these printers. The nice thing about HP Printers is they are Highly backwards compatible. By the way, I recommend a LaserJet over an InkJet because last I heard, the Ink on a sheet printed on an InkJet runs if wet. A friend of mine learned this in the Rain (I'm in Oregon). My LaserJet prints 6 Pages Per Minute. My HP Manual says it prints 2500 pages on one cartridge. The Printer Drum and Toner are one piece. You replace your Toner & Cartridge in one piece. And it's easy to do, even a Tech Novice like me can do it. The stock Base memory is 2 MB of ROM and 1 MB of RAM. I upgraded mine to 8 or 9 MB of RAM. HP doesn't sell more than a 4 MB RAM Upgrade. But I called a company authorized by HP. I think it was called KingFisher Technologies. They sold me an 8 MB upgrade for my HP. I know it will work on both a 5L and a 6L. I'm glad I bought the RAM from KingFisher insted of HP. KingFisher sold me 8 MB of RAM for half the price of what HP sells 4 MB of RAM. My computer never tells me my Laser ran out of RAM. It uses the same paper as a xerox, transpariencies or even peel off Labels. As far as personal experience with compatability of your list of Software below. I use it with PageStream 2.2B/SE and ImageCat v.2.0. I haven't figured out how to use it with PrintMaster. I can use it with First Word Plus and I could use it with Word Writer ST v.2.0 but I haven't made the Printer Driver yet. In First Word Plus, you can write your own Printer Drivers. To write a driver for Word Writer, I take the info for writing a driver for First Word Plus and use it with the Driver creator for Word Writer and I have a Driver. If you want, I may be able to sell you SpeedoGDOS 5. I have to try the disk to see if it works. If interested, E-Mail me. I replaced my SLM804 with my HP LaserJet 6L for some good reasons. I bought some software that speeds up print output. I found out it wont speed up the SLM804 because the SLM804 hooks up to the Hard Drive port, rather than the Printer Port. The Software is OutBurST! v.3.3. I bet your thinking I'm trying to sell you a copy? WRONG! I don't have any to sell. I do know that Frank Pawlowski of Straight Edge still sells and supports it. With it you get programs for your auto folder that speeds up printer output through your printer port. Besides a .prg that works with older printers, it also comes with a .prg for newer printers (Like my HP LaserJet 6L) and I think that program does something called strobing. With OutBurST you get specially modified Printer Drivers for PageSTream & Calamus made to work together with the Auto Folder .prg to really speed up printing. For the HP LJ 4 and up. I use the Auto Boot Program and Printer Driver on PageSTream. Also,

Straight Edge also sells JetSpeed, Printer Drivers for GDOS & Speedo
GDOS for LaserJet Compatibles. JetSpeed works independently of OutBurST!
but really speeds up printing on your LaserJet with OutBurST! And no, I
don't have JetSpeed to sell, but Frank at Straight Edge does and I
recommend it.

==Thanx==

I can confirm that this hardware project works (it's NOT for an STe!), but it might be necessary to remove the GLUE chip and give its pins a clean. A poor display may be the result of oxidation on these pins, which are very fragile.

The driver software is powerful and the docs repay very close reading.

For serial transfers you need a standard terminal program on the ST
with x-modem capabilities. You will also need an x-modem program on the
Portfolio. This can be a problem as it's difficult to transfer it to
the Portfolio if it's not already there!

Se http://www.jollyp2.demon.co.uk/ for lots of Portfolio programs
including parallel and serial transfer solutions to ST's. Somewhere in
the docs there is also a description on how to do the first critical
transfer of the x-modem program from ST to Portfolio.

Joe,

I still have one NEW disk drive in stock for the ST. Its complete with the custom Atari faceplace already installed. Its the newest style faceplate with the small eject button, so unless you have one of the early 1040ST systems, it should be an exact fit. Price, including Priority Mail shipping within the continental USA, is $30. Reply in Email to s.winick@worldnet.att.net if interested.

I do indeed mean the ISDN modem. For some reason or other British Telecom always refer to the ISDN modems as terminal adapters, and so you will hear people over here say that there is no such thing as an ISDN modem, you need a terminal adapter instead. It has always seemed a bit odd to me :-))

(Nicholas - is this perhaps why you said there were no adapters available, thinking that I was looking for something to adapt my modem to ISDN ? I do, of course, realise that there are no such things.)

British Telecom is correct - there is no such thing as an
ISDN modem, because ISDN is digital through and through,
the box that connects between computer and line doesn't
perform any signal conversion between analogue and digital
(MOdulating and DEModulating; MODEM) so it's simply referred
to as a Terminal Adaptor (terminal=your computer).

Actually, ISDN terminal adaptor or ISDN TA is correct. The term ISDN modem
is just used because it looks like a modem. But it uses digital data
transfer and doesnï¿½t have the function of MODulation/DEModulation. This is
what the name modem refers to.

Regards,

Kerstin

5022. Ultimate Virus Killer 2000 for Atari ST/TT/Falcon

Newsgroup: comp.sys.atari.st
Date: 2000-04-23 00:00:00 UTC
From: Richard Karsmakers <richard@fortysecond.net>
Message-ID: <rlu5gs47jr5h898d05c9vn6lkvpaiusf2c@4ax.com>
Source record: 62918
Cross-posted to: alt.comp.virus,comp.sys.atari.st,hacktic.virus

The "Ultimate Virus Killer 2000" is the industry standard virus killer for the Atari ST/TT/Falcon platform. The program has been around for well over a decade, and with the latest release (8.1) it's turned shareware.
There is now an official "UVK 2000" support site where you can download the program, find descriptions of all Atari TOS-platform computer viruses (and their symptoms) and more. It's located at http://www.fortysecond.net/uvk.
This message is being sent to three newsgroups. If you think this constitutes spam, or if you think this message does not belong in your particular newsgroup, please contact me at cronos@atari.org and I will refrain from posting to the newgroup in the future.
Thanks for your time.

5023. ST News International Christmas Coding Convention 2000 reunion! (Atari scene)

Are you a member of the former Atari 'scene'? Did you, perchance, visit the "ST News International Christmas Coding Convention", in Oss, Netherlands, December 1990?

Then you should not wait a second longer and surf over to http://stniccc2000.atari.org to discover that, in fact, a reunion of that very historical event is being organised for December 2000, a 10th anniversary reunion as it were! It is going to be the coolest event of the millenium, I can assure you!
In case you've already surfed over to that site in the past year or so, be advised to check it out again, as it's been overhauled utterly! It looks way cooler now, and contains a lot more information!

I never had any problems with installing Minix XFS on my old ST FM with its stoneage Gasteiner drive, but it really complains when I try it on my Falcon with HD Drive 7.71. (I always go for a V2 partition.) Can the problem be fixed with a newer version of Minix XFS, if so where can I find it ? There's no point in messing around with MiNT unless you've got a proper file-system. I've only got the old TAF distribution on the FM, I'd quite like to copy the (admittedly ageing) KEMD files across. Anyone tried out that STiNG networking package ? Can it work via MIDI as I don't want to mess around unplugging my modem ?

Have Fun,
"Augeas"

Hiya

Gemulator suppose to be great... And so is Gme. 3 (the PD) one... but when I
tried it I got the same result, absolutely zinch...

I'm after the program that goes with the commercial Gemulator if anyone has
it lying arround, the Gem explorer thing!

In order to get Gemulator 2000 to work with one of the TOS rom files, you have to place the file in the root directory of your hard drive and you have to rename it to something like magic_pc.os . This should work. If you place the file in another directory, you then have to use the browse option to tell the program where to find the TOS rom file.

Hope that helps.

and so you
: will hear people over here say that there is no such thing as
an ISDN
: modem, you need a terminal adapter instead. It has always
seemed a bit
: odd to me :-))

The word "modem" comes from "MOdulator-DEModulator" and refers
to the analog modulation-demodulation from/to digital signals.
Since the ISDN isn't performing any such modulation-demodulation
at all, it's highly improper to call it a modem. The device you
use to hook up your computer to the DIGITAL (= NOT ANALOG) ISDN
phone line is therefore properly called "terminal adapter".

Last Updated 04/23/00
- New Items Added, Sold Items removed

I have the following Atari ST components, software and manuals/magazines for sale. All the equipment is cleaned and detailed, and in good or better condition, but without boxes unless noted. If you have any questions in regards to unit condition, please feel free to ask.

All prices quoted are in U.S. funds with the buyer paying shipping. For items that I am taking offers on (no price listed), please make all offers in U.S. funds. I am also willing to trade for certain items, please see my list at the end of this post.

If you are interested in any of these items, please respond to Jim at jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.ST (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

Hardware Please make an offer
==========
- Atari 520 ST - with mouse but missing power supply (fully functional)
- Atari SC1224 Monitor 13" ST Color Monitor
- Atari PCT1426 Monitor 14" High Resolution TT/PC Color Monitor - deal pending
- Viking 1280 x 960 20" Monochrome TT Monitor - Boxed - deal pending
- Atari SF354 3.5" Floppy Drive - with drive cable, no power supply
- Atari SLM804 Laser Printer - boxed with power supply and Laser Printer Controller - deal pending
- Roland PR1011 Dot Matrix - Boxed with Cables
- Atari Megafile 44 with built-in Tape Backup - with power supply and cable
- Atari Megafile 60(s) - with power supply (two units left)
- Magic Sac 1 - Macintosh Emulator Cartridge (with manuals, but NO ROMS)
- Magic Sac 1+ - Macintosh Emulator Cartridge (with manuals and ROMS)
- Custom made Atari RGB/Audio cable. Connects an Atari ST to either a SONY XBR or XBR II RGB Monitor
- Best Data Smart One 2400X - External 2400 baud modem with power supply

Controllers Please make an offer
==========
- Paddles (multiple sets) - for Atari & Commodore units

- 2x Suncom Tac Joysticks - for Atari & Commodore units
- 1x Spectravideo Joystick with suction cup base - for Atari & Commodore units

ST Software Please make an offer
==========
- UltraScript for MEGA ST- by Atari (with manual & software)
- Ultra Script Type Collection - Packages 1-7 (Complete with box, manuals, & software)
- Macro Mouse - The mouse recorder (Complete with packaging, manuals, & software)
- Calamus Desktop Publishing (Complete with box, manuals, & software)
- Spectre GCR Mac Emulator with ver. 3.0 update manual (Box, manuals, software - NO ROMS or cartridge)
- Flash Telecommunications package (Complete with packaging, manuals, & software)
- Flash II Telecommunications package (with manual and software)
- Dungeon Master - by FTL (Complete with box, manuals, & software)

ST Books Please make an offer
==========
- Atari ST Volume One VDI
- Atari ST Volume Two AES
- Atari ST GEM Programmers Reference
- Atari ST Tips & Tricks
- Atari ST Internals
- Programmers Guide to GEM
- MC68040 32-Bit Microprocessor Users Manual - by Motorola
- MC68000 8/16/32-Bit Microprocessor Users Manual (eighth edition) - by Motorola

Manuals & Technical Guides (software status specified) Please make an offer
==========
The majority of the ST/TT manuals are of the binder variety
- Micro C Shell - by Beckemeyer Development Tools (without software)
- LDW Power Spreadsheet - by Logical Design Works (without software)
- Superbase Personal - by Precision Software (without software)
- dBMan - by Atari (without software)
- 1st Word Plus - by Electric Distribution (without software)
- HyperPaint - by Atari (without software)
- Easy Draw - by Migraph (without software)
- Regent Base/ Regent Base 2 - by Regent (without software)
- Publishing Partner Professional / PageStream -by Soft Logic (without software)
- Publishing Partner - by Soft Logic (without software)
- Touch-Up - by Migraph (without software)
- Microsoft Write - by Atari (without software)
- Codekeys The Macro Tool - by CodeHead Software (without software)
- Degas Elite - by Integral Solutions (without software)
- Brataccas - by Psygnosis (without software)

Atari Force Comics Please make an offer
==========
All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for or towards rare or shrink-wrapped/sealed
titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- A working first generation Dish Network receiver
- A working Phillips or JVC 4000 series Dish Network receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard (should I
be so lucky :)

Yes, it can be a bit of a struggle to get it fired up. TOS images in the
right place? Have you done the initial set-up menu option which seeks (and
remembers) the location of the TOS files?

>emulate the printer port?

I do! Still find 1WP the easiest and fastest way to get justified text
and attributes, then print it out in IdeaList. For many things I don't
need the bells and whistles of a DTP program, only justified text with a
few bolds and italics thrown in, using the printer's fonts for faster
output. Often I also print with NVDI's Speedo non-proportional fonts.
IdeaList may be the best way to go for the original questioner, *if* he
finds an IdeaList driver for his DeskJet. I have constructed some
comprehensive drivers for the DJ 520 for both 1WP and IdeaList, but his
printer may not understand the same commands.

Regards, /Peter/

Yes - had a few days in bed but now up and about again. I started the ET4000 translation, but got a mail from Italy telling me to stop as it was available already on a web site - sorry I don't have the reference to hand. I also didn't get a reply from the original author, Dr. Thorston Lang, who (I believe) has to supply some EPROMs or equations to blow your own in order for the project to work.

They're GALs not EEproms but similar kind of thing. The equations
files to programme these GALs are not in the original archive, they're
in an extra one on vezzs page. Two of these need to be programmed and I
have recently bought the neccesary hardware that plugs in the printer
port. I am going to set up a small business where I programme GALs
for people in a few months. (quicker if there is a big enough
response).

I'll have an Atari ST (i don't know exactly which model it'll be).
So I searched some site about Atari. I found a lot of site of .ST and .MSA
game files but i didn't see any utils or recent demo file.
Nothing, nada, rien...
Where can I find that ?
Is there a site where I can have daily news ?
Where is the scene ?? Died ??? I don't hope that...

Thanx in advance.

Ditto, I made one for a Mega a couple of years ago. Works really well,
except that accessing anything on the ACSI-bus would enable Lacescan
unconditionally. It's possible that I cut some corners when I made it
though, as I never intended to use the ACSI-bus anyway.

> The driver software is powerful and the docs repay very close reading.

Yup. I was able to get 736x480 on my SM124 with it, and 768x256 (?) on my
TV after some tuning. It really makes a difference, especially on that
small 124.

If you are running NeoDesk 3.04 or higher, there really isn't
much advantage to getting TOS 2.06 that I can tell. TOS 2.06
adds some "NeoDesk like" features, like the ability to drag
items to the desktop, "Show Info", etc.. TOS 2.06 also allows
for larger HD partitions, if I recall. If you also have Geneva,
I can't think of any reason you'd want to use 2.06 outside of
the HD partitioning.

It's more than likely a Hybrid Arts HD recording system. Its aim was
toward film recording and was used on a few Hollywood movies. HA later
tried to expand the system and later died aka sold off to someone then
died. It was one of the earlier digital systems for film sound track
recording.

```
Try the umich archives. It's not very active nowadays, but there's a lot of
old programming stuff that might fit your needs.

> What about a reasonable Word Processor?

Papyrus, commercial but as good as Word and runs in 2 Megs. An STE is easily
expandable, so no problem.

> Bank account management.

Dunno

> Internet connectivity - email, Usenet.

STinG. Check out the Quick FAQ.

For some strange reason, the TOS file must be called TOS206.IMG, even if
it's another TOS version, and must be at the root of your C:\ drive.

Bill,

I have an extra floppy drive I/O cable. You can have it for $5 plus shipping cost ($3.20 for Priority Mail within the continental USA). If interested, reply in Email to me at s.winick@worldnet.att.net. I also have an old Atari mouse that's no longer working properly. If you think you can fix it, you can have it for free with your order.

FamilyNet HQ: Telnet:\\www.family-bbs.net

Hi folks, I have a CD-ROM system which used to read CD-rom's for its files
or be used as a CD-ROM player.
Now it can play CD-ROMs, but it won't recognize CD-ROMS with programs on
it as valid.

Here is a little bit about it:

Hardware:
Computer: 1040 STE 4 Meg
CD-ROM : Chinon 2 speed / Caddy drive
ICDLink2 from computer to external hard drive
then hard drive to CD-ROM.

Software
ExtenDos.

It sees audio CD's but not program CD's. Any ideas?

Hei Doctor.
Which version of ExtenDos do you have, as you may find that
some of the latest file have been writen on pc. At present I am using
version 3.2b which handles joilet set {longfile}. Have a look at its web
site.

There must be one on umich or ftp.lip6.fr, but forget those programs, they
are pretty bad by today's standards.

I've following the progress of Sparemint with interest. It really
does look worth trying now that the GCC package is available. (Linus Torvalds
has said the GCC is realy the only bit of the F.S.F. worth having...) The
trouble is Sparement needs a semi-working Mint installation to function, for
which I need a proper Minix partition. It's very frustrating that they don't
intend it to be a complete Mint disribution. KEMD is venerable, but it's
"of a certain age". Sparemint should be burned onto a CD with a proper
GEM installer which gives you the proper directories, a working version of
RPM and some basic tools. If the NAES mob were to supply their software on
CD bundled with such a distribution they'd shift a good few more units...
If I can get an XFS partition I'll install KEMD with just the basic packages
and try to buid the rest with the Sparemint RPM.

>
>Lots of stuff can also be found on the Belgian ftp-server

Some people (IIRC Jo Even Skarstein and Martin-ï¿½ric Racine) are working on
and easy-to-install MiNT distribution.
Yesterday I discovered MiNT-net for dummies from Marc-Antï¿½n Kehr. It
explains almost everything what's needed to set up MiNT-net but alas the
text is *GERMAN* only. His package contains also an archive which holds
all the necessary stuff. You only need to extract it on a Minix or
ext2fs.

You can find it on http://www.ndh.net/home/kehr/atari/Atari.htm

to be more precise: http://www.ndh.net/home/kehr/atari/mfd-dist.zip. Be
aware the zip file is 2.7 MB.

On that page you can also find a GEM frontend for pppd.

>KEMD is venerable, but it's

KEMD is indeed old but for the time beeing it's still the best package.
I don't like GEM installers but I agree that such a thing would attrack
lots of people.

Which STing version are you using? You really must use the latest one,
v1.22. Due a configuration fault somewhere outside the RMA some TCP/IP are
unable to connect properly to the RMA. The programmer of Sting was so kind
to adapt STing so that STing user could access the RMA again.

They also did one called MASTERSCORE which as Nicholas said was
incorperated into Cubase score.

Another Scoring software was SHARP SCORE which is a fantastic package.
Uses GDOS..SPEEDGDOS font system.Worked best on a HD though. There are
some shareware scoring programs available on the UMICH FTP site. Though
not as good as the above at least lets you enter notes, ect to perfect
a score.

BTW..if you use Atari for Midi come join us on the Atari-midi mailing
list. See sig

Quite unlikely, since Atari's are such a small market, there wouldn't
be much incentive. The people who make these things generally want
the biggest effect possible (and if they make the evening news, so
much the better).

..

>I do not enjoy trouble for those using a PC, but I

Aw, why not? ;)

..

>PS:
>It is a shame not having any browser for Atari taking

Yes! Adamas/Drcaonis isn't nearly up to the task, at least from what
I see of the demo and hear on the newsgroups. You might as well say
that nothing exists for us yet.

>It means that I can not pay my bills as cheap as
>people using a IBM\Microsoft PC. That is no good!

Not to mention the increasing number of sites that won't even allow
you access without Javascript.

>I have read about the Draconis 1.7, but what I have
>read does not seem to promising.
>I would gladly like to pay some money for upgrading my
>CAB to take JAVA.

I'm sure most of us would!

>But I suppose there will be no further development for
>CAB.

Not likely, as A. Clauss has understandibly found a more profitable
platform to program for.

>Perhaps there will be a solution?

I have a couple propositions for anyone with the programming
experience and willingness to tackle such a project:

1. A new "open-source" browser.

- Different pieces of it worked on by different people,
thereby speeding up the process.
- Free, as in the Linux philosophy. I'm sick of us having to
pay large amounts for mediocre browsers that are less
functional than the demo version of CAB.

2. Some sort of workaround for CAB.

- Create a new CAB.OVL. Instead of downloading the page
directly to CAB, it checks to see if the page has any
Javascript in it first. If not, it sends the HTML to CAB as
usual.
- If there is Javascript, it cuts the Javascript section out,
placing it in a separate file, and adding an "EMBED"
command to the HTML code, pointing to that file. The new
HTML code would then be sent to CAB.
- A separate Javascript viewer program can then be set using
OLGA (like Aniplayer is for viewing video QT-VR files).
This program will then be in full control of the
Javascript, adding what is necessary to the page in the
same way Aniplayer adds the interactive video and QT-VR
sections to pages.
- This CAB.OVL could also be used to include CSS by adding
the appropriate info to subsequent pages downloaded from
the same domain as the original CSS information, then
sending the updated page to CAB.
- I'm not sure how possible this is (so please advise me if
I'm missing an important detail), but from what I've
seen/read/understood, this should be possible.
- Using this method one could add almost any feature to CAB
that's necessary to keep it up to date without needing to
update CAB itself.

Anyone willing to take on either of these ideas? We desparately need
a browser that is complete and up-to-date, otherwise our computers
are doomed to obsolescence, even the new Milan II. PLEASE SOMEONE
HELP!!!!!!! Thanks! :)

Hello!

We are in desparate need of a complete browser. Adamas and Wensuite are nowhere near adequate, and CAB is becoming more and more obsolete with each new Javascript page put on the 'net. We need some ideas and programmers willing to aggressively apply these ideas. I have a couple propositions for anyone with the programming experience and willingness to tackle such a project:

1. A new "open-source" browser.

- Different pieces of it worked on by different people, thereby speeding up the process.

- Free, as in the Linux philosophy. I'm sick of us having to pay large amounts for mediocre browsers that are less functional than the demo version of CAB.

2. Some sort of workaround for CAB.

- Create a new CAB.OVL. Instead of downloading the page directly to CAB, it checks to see if the page has any Javascript in it first. If not, it sends the HTML to CAB as usual.

- If there is Javascript, it cuts the Javascript section out, placing it in a separate file, and adding an "EMBED" command to the HTML code, pointing to that file. The new HTML code would then be sent to CAB.

- A separate Javascript viewer program can then be set using OLGA (like Aniplayer is for viewing video QT-VR files). This program will then be in full control of the Javascript, adding what is necessary to the page in the same way Aniplayer adds the interactive video and QT-VR sections to pages.

- This CAB.OVL could also be used to include CSS by adding the appropriate info to subsequent pages downloaded from the same location as the original CSS information, then sending the updated pages to CAB.

- Using this method one could add almost any feature to CAB that's necessary to keep it up to date without needing to update CAB itself.

- I'm not sure how possible this is (so please advise me if I'm missing an important detail), but from what I've

seen/read/understood, this should be possible.

Is anyone willing to take on either of these ideas? We desparately need a browser that is complete and up-to-date, otherwise our computers are doomed to obsolescence, even the new Milan II. PLEASE SOMEONE HELP!!!!!!! Thanks! :)

I hate to rain on your OVL parade but it's the OVL itself that is
part of the problem. It wasn't well thought out when it was put in
place. That's not to say it's utter crap, much to the contrary all
the OVL authors have done wonders with what they were given. Just
that Alex started with an off-line reader and attempted to retro
fit it into something else.

A real attempt would allow multiple open connections, rather
than one file at a time. In fact on other platforms this multi
connection concept is configurable.

It also seems that Alex didn't want to commit to one OS, hence the
OVL idea, but again it's just not robust enough.

I think a new browser would be better, or one of the current
ones which has the socket code built in should be reworked
in a serious way, or made open as you suggest.

Has Jpeg2000 hit? If so that would explain files with the jpg
extension that refuse to load. Yet another problem. ;-)

It was not! Cubase Score and Masterscore are completely different. I
have them both.

There were two versions of Masterscore:
I: Rather primitive and hardly usable at all.
II: Really very capable with lots of functions but buggy...

They are both protected by dongles.

I have seen Masterscore for sale at "Musikbï¿½rsen" for SEK 1995:-
Give them a call at +46-(0)21-131295 if you are interested.

Alexander Clauss once email me and said Cab would be Javascript compatible when someone wrote a Javascript interpreter. I have heard that is being done, but I have seen nothing. The author of Newsie says he will have a Javascript Gem program out soon that will have the VA-Start. This may help in that Cab may be able to use it when trying to get on some Java sites. I am not really sure. I am not sure about Adamas. The new version 1.7 is suppose to have the Javascript module. I do not know if it works good or not. I have heard that 1.6 does not function too well. There is a new browser called Hotwire that will be coming out that, according to the author, is better and faster than Cab. At first it will not have Javascript-compatiblity, but will in later versions. About the only sure way of getting on Javascript sites on an Atari is to run Linux and load in one of the Javascript-compatible browsers that exist. You are correct, we need one now. Too Bag Mr. Clauss abanddoned us in favor of iCab.

Which (unless I'm missing something) means that unless I repartition the Zip disks (partitioned on the Falcon long before I got the PC) with a compatible DOS partition(s) - and lose all the data in the process - then there's no way I can read my old Zip disks on the PC (including using Gemulator)?

Try an ISO9660 CD if you have any about (all Atari CDs and most
DOS based CDs). You may be having trouble if the data CD isn't
8.3, although the current version of ExtenDos handles this.

Well, the Syjet is on hold pending a tiny problem of the guy who
was supposed to send the cartridge not doing so. Apparently
interesting things happen if you try to partition a Mac
cartridge without formatting first. Anyhow, while I'm awaiting
my bids on Ebay to come through, a few questions:

1) Has anyone found a problem with SCSI sensitivity with the
Syjet? (I'm planning on making it 4th of 5 physical items).

2) Is there anything unusual with the formatting/partitioning
process I should know about?

3) With 750/750 Mb partitions, what should I set my partition
size for in HDUTIL? 16K?

The Atari Club in New Zealand still exists and we get a magazine from the Melbourne club, which I understand has integrated with a PC group. I believe that the Adelaide and W.A. clubs are still running, the W.A. club also now incorporates PC users, as indeed does our NZ
club.

Mario Becroft has some hardware products developed for the Atari and is still developing other products. His webpage is:

I agree. I can't recall the exact res. I was able to reach, but I'd definitely
reinforce the need to have the hor. res. as a multiple of 32, and to have the
hor/vert res as a 4:3 ratio.

>just behind magxboot.prg in the auto folder, and like Steve Sweet already
>mentioned these applications need WDialog as well...

MGNOTICE requiring NVDI? Most likely. But as far as requiring WDIALOG, not
in my case. I've used MGNOTICE successfully for over a year and a half
(ever since I first installed MagiC 5), without any difficulties
and more importantly, __WITHOUT__ WDIALOG.

It seems to be the type of problem that COMES and GOES every once in a
while - only this time, the "go" part doesn't seem to be happening... ;^(

The last time I ran into this trouble, I think I basically just recopied
from a backup just about _all things_ on C: related to MagiC and NVDI, and
it cured the problem. This time, it doesn't seem to be the solution.

And as far as WDIALOG, I have it, and occasionally make use of it in TOS
mode for some things, but if used with MagiC when running CAB 2.7, you'll
notice that all of CAB's ICONs take on the appearance of the old CAB 1.5 (I
believe this bug is even mentioned in the CAB 2.5 manual). So therefore,
WDIALOG is seldom used on my system.

5111. Proscore - any ideas?

Newsgroup: comp.sys.atari.st
Date: 2000-04-26 00:00:00 UTC
From: mcanny@totalise.co.uk
Message-ID: <8e69jcckt1@nnrp1.deja.com>
Source record: 62888

Please accept my apologies if I am posting this message to the wrong group.

My Fianc&#65533;e used a piece of music composition software called "Proscore" a few years back (probably between 1990 - 1994) whilst at school and liked it a lot. I recently obtained an ST and am trying to find this software for her.

I believe it was made by Steinberg but extensive searches on the web haven't helped me - there is a piece of shareware with the same name available from http://www.pressenter.com/~tkelly/ but alas this is a different product. The original software she used came with a "dongle" to ensure it was the original version and allowed users to play a note on the piano and then see it appear on screen via the midi input - basically you played your composition and then it appeared on screen in notation.

If anyone has a copy they want to sell or has any additional information on the software please let me know - any information on similar software and music packages for the ST would also be good.

Sorry if I am being vague, any help or advice would be greatly appreciated, if you could reply to me by e-mail as well as posting to the group this would be excellent.

Thanks
Michael Canny

Undoubtedly it did more than just this ;-) I suppose this is some sort of
scoring app. The scoring functionality was later incorporated into Cubase
Score.

You're out of luck, because Steinberg no longer supports any of the Atari
programs that made their fame, and at the same time refuses to release any
of that great old software to the public domain. Their position is that they
want people to migrate to the PC or Mac and buy their overpriced buggy new
software.

The result is that Steinberg is guilty of depriving the music community of
some of the best tools that were ever made, and hurting the Atari community
that made it's fame.

Anyway, the answer to your question is that you have to find this software
on the second-hand market. Cracked copies won't do because of the dongle
protection.

From: e-n-bor@frisurf.no
Message-ID: <956771850-870851AEicMi@frisurf.no>
Source record: 62895

Hello!

Today 26/4 at work, we were all adviced not to use our

private computers.
A bad kind of virus had infected 13 of the computers
at work and destroied everything on the HDs and made
such a mess in the BIOS that the main boards on most
of the PCs probably have to be exchanged.
(Of course it is possible to put in a new BIOS-chip
but who wants to do all that soldering?)
I find it very strange that a virus can make such a
mess that the hardware is impossible to use any more.
Is it possible that a virus will make such trouble for

an Atari computer too?

I am honest when I say that I really feel very sorry
for the people having to try to restore it all again
after this "infection".
I do not enjoy trouble for those using a PC, but I
really think this a nice adverticement for IBM and
Microsoft!
For once I am glad I am still using my Atari.
I do not have to bother about this spesial virus and
can do my mailing as usual.

PS:
It is a shame not having any browser for Atari taking
JAVA!
It means that I can not pay my bills as cheap as
people using a IBM\Microsoft PC. That is no good!
I have read about the Draconis 1.7, but what I have
read does not seem to promising.
I would gladly like to pay some money for upgrading my

CAB to take JAVA.
But I suppose there will be no further development for

CAB.
Perhaps there will be a solution?

I noticed that I was able to reclaim my GEM Partitions, when using the
linux bootstrp prg with no ill affect. Its true you will not be able to
read your atari partitions under linux, as it uses its own partition of
LNX and SWP. But reclaiming is no problem.

: of the PCs probably have to be exchanged.

Yesterday was 14 years since the Chernobyl disaster, it was also the activation date of the CIH virus, also called the Chernobyl virus. The CIH name comes from the initials of Cheng Ing-Halu, a 24 yo Taiwanese who was the creator of the virus.

The CIH can erase the Flash Bios of an Intel 430TX chipset Pentium motherboard. Regardless of chipset, the virus can also overwrite any information on the harddisk. CIH apparently attacks only W95/98 systems.

See also:

http://www.datafellows.com/news/2000/news_2000041900.html

BTW, those Flash BIOSes can be recovered, but it requires both knowledge and equipment...

: >But I suppose there will be no further development for
: >CAB.
:
: Not likely, as A. Clauss has understandibly found a more
profitable
: platform to program for.

I wonder about that. Just recently I was reading a column with tips for Mac surfers where Icab was mentioned. They said Icab was ***free*** of charge, but not capable of taking "advanced sites". You can check it out yourself at:

www.icab.de

It is uncomprehensable to me why Alexander Clauss thought it more interesting and profitable to add yet another browser to the MacIntosh computers when there already were free (and very advanced) browsers like Netscape and Internet Explorer on that platform?

If you prefer, you can also run BeOS on the Mac, which is also free and contains an excellent browser as well. There are also Linuxes for the Macs which all contain at least Netscape.

In my opinion the best browser today is Microsoft's Internet Explorer. I know that the PC (Politically Correct) opinion in all hackerdom and computerdom is to hate Bill Gates and his gigantic company, but that attitude is highly irrational. If Mr Gates claims that 2+2=4 then I can't but agree. And IE *is* an excellent browser.

If it is any consolation for the Microsoft haters, the Internet Explorer was conceived and developed by a small company that got bought up by MS just because they had this marvellous browser...

Sun used to have a browser entirely in Java, which they seem to have abandoned in favor of Netscape. Sun has also recently released a Java-interpreter chip which could maybe in the future be included in some kind of expansion card to the Atari range?

Sad to say, Atari is today lagging seriously behind in all things Internet, and those applications are the meters of any platform's useability for any home (and office) computing.

Hopefully the new Milan 2 will come with Linux or BSD as the default installed system, which would at least mean a wealth of free software for the brave purchasers of that computer... if it ever gets released?

In the mean time we will be thinking of dedicated uses for our old Atari machines. Fax-machines, teletype terminals, MP3 players, MIDI editors etc.

Everyone keep in mind that the only reason browsers are where they are on the PC/Mac is because Mosaic source was readily available for them. Without that, Netscape and IE would not be here. There is no Mosaic equivelant on for TOS and no one has written a browser and been kind enough to release the source for others to work on. One man cannot create a fully functional browser a la Netscape or IE. These browser were built by a team of people. I call for the release of the source to CAB or any one of the browsers that is not actively being developed. Let some of the other brilliant programmers have a chance to improve on a solid product.

> you know, there is no one out there who doesn't have access to these
> technologies?

No. But the point is that there are lots of people who don't have access
to these technologies. It is for this reason that the W3C have issued
the accessibility guidelines, to broaden awareness of the problem and
provide solutions.

If you are creating a web application which relies on some new
technology and it can't be done any other way, then you have to accept
that some of your potential audience won't be able to use it. It's not
ideal, but there you go.

OTOH, many sites use JavaScript, Flash etc largely as window dressing,
ie the site *could* be made accessible, it just hasn't been (for
whatever reason, probably lack of awareness of these issues). One way
round it is to provide a text-only version of a site (many sites do
offer this), but this usually involves maintaining two versions. You can
do some of the work by using something like BETSIE which strips a site
down to text-only on the fly, but this won't compensate for a site which
just has a row of JavaScript drop-down menus on its front page and no
real HTML links, for example. However, it is perfectly possible to
produce web sites which use newer technologies but don't exclude users
of less-capable browsers. Check the guidelines for techniques, many of
which are quite easy to implement.

Except that by that time something else will have come along. The point is that these devices are inherently less easy to upgrade than computer-based browsers. They will always be lagging behind, so if you want people to use your site you need to make it possible through thoughtful design.

It's interesting that the needs of disabled users and the design techniques involved in meeting those needs are similar to those with respect to mobile access and access using minority browsers. And indeed the design techniques are good principles in any case.

Far too many web designers just test in IE and Netscape (usually latest versions of both), when actually it's very revealing to also test in a text browser such as Lynx and a minority browser like CAB. Lynx in particular is an eye-opener on many sites.

Fortunately a lot of sites are catching on, particularly WRT usability, which is why frames are disappearing and navigation bars appearing again, for example.

5131. Change of web site address

Newsgroup: comp.sys.atari.st
Date: 2000-04-27 00:00:00 UTC
From: John Whalley <news@whalley.demon.co.uk>
Message-ID: <956862282.19558.2.nnrp-04.9e985e5c@news.demon.co.uk>
Source record: 62758

Hi,

As some of you may have noticed from my sigs over the last couple of days, my email and web site addresses are changing. Currently the existing addresses still work, but over the next couple of months it's likely I'll change ISP, so I've got myself some redirection set up. This means that if you start using the new addresses as of now, when I move the site etc you won't have to change again. See my sig for the email address (in anti-spam form).

My main web address (formerly http://www.whalley.demon.co.uk/) is now:

http://www.bygjohn.co.uk/

The atari section can be accessed directly via:

http://www.bygjohn.co.uk/atari/

or via an Atari.org redirection:

http://bygjohn.atari.org/

The Atari section includes the MagiC Documentation Project page and the Atari y2k page.

>'withdrawal' pains envolved!!!

Exactly! Here's my situation at home. I live in a relatively small apartment. I use my Falcon for Music/MIDI apps, which as stated many times before is better in many ways than Mac/PC equivalents. My wife and I are extremely frustrated with the lack of web usability with the Falcon, and have contemplated purchasing a different computer for that express purpose. The problem: We have absolutely no space for two computers. Hence, I would be forced to give up the Falcon and we would have to spend lots to get the newer computer (probably a Mac) up to a similar usability in the Music/MIDI arena. So it would be well worth my money to invest in a really good, modern, up-to-date browser, if there was such a thing. So basically, I'm calling on those people who have the ability to consider putting work into the project. I would especially like to see source code for CAB released (a-hem, Alexander Clauss are you listening? Probably not...) and updated or used as a basis for a new browser so that we don't have to wait for another browser to slowly develop to the point CAB already is at. I guess I'm just trying to be the squeeky wheel here and hopefully spur on some advancement here. Anyway, my 2 cents!

Opera).

True, but less buggy than Netscape (the CSS "support" in which is
appalling). Hopefully Mozilla will be better.

> > Hopefully the new Milan 2 will come with Linux or BSD as the
> > default installed system, which would at least mean a wealth of
> Then why buy a Milan if it is used to run some *nix clone?

Exactly. If you're going to buy a Linux box you might as well get a PC
as there is some software for Linux/Intel which isn't available for
Linux/m68k (ie the stuff which isn't open source). I guess you could
then use Stonx or OSIS (have I got the name right?) for the Atari stuff.
But then you're back to the emulation argument we had a few weeks back.

I thought the point of the Milan was that it was an Atari clone.

> I doubt it. There will always be smaller and cheaper devices. Could
the
> future of Atari web browsing be in the WAP protocol ?

Doubtful: there is a reasonable argument that WAP is likely to be just a stopgap (NB this is crystal ball gazing).

Next generation mobiles with much greater bandwidth are more likely to be in a form where you have essentially a PDA with a small screen (but bigger than a WAP display and probably in colour - more like a Palm), with a small headset connected via Bluetooth. This lets you have hands-free operation while being able to use the screen which will be capable of rendering real HTML. But not for sites which have been designed for a fixed screen size of 1024*768, though!

BTW the franchises for this next generation of mobiles have been announced today for the UK, so the first batch of services to go live are likely in a couple of years. I suspect WAP will slowly die out after that.

Just my two penn'orth,
John

> Not to mention the increasing number of sites that won't even allow
> you access without Javascript.

This is just poor design, and has implications not just for Atari users. It also potentially excludes users of basic browsers in PDAs, next generation mobile phones, TV set-top boxes etc. Which is quite likely the growth area for new people accessing the net (there is a view that most people who are going to buy a computer for the job have probably done it already). The "old" philosophy of using every new bell and whistle for the sake of it and assuming the world can or will update its browser/download another plugin etc is on the way out.

The other area of exclusion is people with disabilities who use specialised browsers (one example being visually impaired users who use a text browser such as lynx in conjunction with a screen reader/speech synthesiser). The W3C has issued accessibility guidelines which make for interesting reading (once you get past the rather opaque terminology). These state clearly the need to make alternative provision wherever technologies such as JavaScript etc are used/relied upon exclusively.

There is an interesting development in the UK, in that with the arrival of the Disability Discrimination Act, where a web site is a core part of an organisation's service, it has to be made accessible. I suspect that some companies and organisations are in for a shock on this one...

Jo Even's NewbieMiNT package is basically a better MultiTOS, with
a GEM installer: MiNT 1.15.x kernel, AES 4.1, MiNT-Net. It
should be enough for most people.

My own distribution (still under development) is more like a new
KGMD, but without a lot of those obsolete packages and with some
clear instructions that do not assume prior UNIX familiarity.

This is correct. BUT: In case Linux is installed on your PC you can also
mount TOS compatible partitions if you have configured your kernel to
support TOS partition tables.

No, This process is the same for any SCSI drive. Note that formatting is
not necessary with media that don't have bad sectors.

> 3) With 750/750 Mb partitions, what should I set my partition
> size for in HDUTIL? 16K?

Please refer to the manual: There is no need to make any special
settings.

You don't understand the concept of JavaScript - it's not a simple script language that is parsed before the page is viewed by the browser. It can interact with the HTML code and therefore it can't be simply parsed like PHP or Perl.

>
> - If there is Javascript, it cuts the Javascript section out,

I can write JavaScript code outside HTML-Tags and inside HTML-Tags. So Embed would not work.

That would mean to write a whole new browser. You can only emulate a small part of CSS using FONT-Tags and it won't help speeding up CAB :-)

A good browser needs time and both Adamas and CAB are/were one-man projects. The problem with open source is that it needs enough programmers. And I don't see that many active Atari programmers who have enough skills to contribute to such a project.

Linux can't convert TOS compatible drives to DOS compatible drives. This
requires repartitioning and thus destroying the data on the drive. In
this respect Linux is not different from other operating systems.

As it was pointed out several times before: JavaScript and Java are
completely different things, so a JavaScript GEM program won't help
nothing for web pages using Java.

> Too Bag Mr. Clauss abanddoned us in favor of iCab.

Yes, it's really a shame that he decided to earn some money - he
could've made his living from just the thanks of the Atari community ...

When Atari computers will have Flash-EPROM, and someone write virus like
CIH (Chernobil), yes.

Btw. BIOS is usually in socket in PC mainboards - at least I didn't see
othervise, so it's easy to reprogram chip.

I disagree. Many people have volunteered to upgrade CAB into
OS specific versions with built-in sockets (e.g. no CAB.OVL)
plus new features like CSS, HTML 4 and Javascript. Since all
those people are interrested in upgrading different parts, it
would have been easy to pool them.

With TOS in ROM and no programmable BIOS, most Atari's are immune. Once the computer is shut off, it's gone it not written to the boot sectors or attached to a file.
>
> Not likely, as A. Clauss has understandibly found a more profitable

I don't see the point of jumpting platforms. Atari users have to pay for their programs, Mac and PC has too much good free stuff. Who will pay for a Mac version of CAB or Pagestream? Beats me how these people are making it.

It should also send a bogus code to the website to fool it into thinking the Java code is accepted and executed. This Java stuff seems largely for the dumb ads they want to send you anyway.

browser is an extremely complex and timeconsuming task if you want to go
beyond CAB.

> 2. Some sort of workaround for CAB.

> - Create a new CAB.OVL. Instead of downloading the page

This won't work. The whole point with Javascript is to manipulate objects
in the rendered HTML-page and the browser itself, no way you can do this
from an external program as long as CAB isn't designed for this.

I believe this is the main reason why Alexander Clauss stopped developing
CAB - it started out as a simple HTML parser/renderer (which is a tricky
thing to write in itself) which simply wasn't designed for the
object-oriented approach needed by Java/Javascript.

Also, the CAB<->OVL interface is very, very limiting, e.g. there is no way
to allow multiple downloads. This seriously cripples it.

Ok, then here's another idea: Get these people together and either connect them with an existing project (Wensuite, Adamas, Highwire, etc.), have everyone in the newsgroup petition Mr. Clauss to release the code to CAB to these people for upgrading (you'll probably have to work with ASH as well for this), or find someone willing to write another HTML browser along with these people all completing the separate parts.

Not necessarily true. I have seen some pages that make good use of
Javascript. Javascript isn't just a slick new way of advertising. I
think it has some good uses that we as Atari users are barred from in
the future unless we get a capable modern browser. The longer it
takes us to get this together, the further behind we are going to get.

As I said, I wasn't sure how possible it was, as I obviously was
missing some details about how it worked. Oh well.

> I've just been asked how you can cancel the Auto-Folder from running
> when booting up an Atari.

Either delete the folder if its not needed, or delete or rename the programs in that folder that you don't want to auto-load on bootup. For example, change the filename extensions from PRG to PRX for the programs you don't want to auto load, then if you later decide you want them to auto-load again, just change them back from PRX to PRG. There are also programs that can let you select which PRGs you want to auto load (which essentially just automates the process). Check some of the online libraries and you should be able to find them.

5180. MINT Help...?

Newsgroup: comp.sys.atari.st
Date: 2000-04-28 00:00:00 UTC
From: Bruce <brew@fast.net>
Message-ID: <sgjjdm607qo176@corp.supernews.com>
Source record: 62698

I just installed MiNT that I d/led from ftp.funet.fi... I followed the instructions to the letter.... and I copied the KEMD stuff over as well and the english was just fine but I've reached the reboot stage and when it reboots it hangs after the Ramdisk Filesystem for Mint loads.

Any one have any ideas?

Thanks
Bruce

Is it a potential basis for a new Atari browser, or would it be too
big/slow? I've never used it as last time I looked it was Unix-only (and
I haven't got a Unix/Linux box).

Does it have an authoring module too, then? Sounds even better!

Fact is that just only a few guys knows about the Highwire project. I would not have know it myself if I hadn't been on the Stafford show last year.

>I am sure that is
>not the case with "Highwire", and certainly the author is actively
>working on it now.

I surely believe you. As you maybe remember during the last Stafford show I've had a little chat with Robert. I never show such passionated man like Robert. He is the man we are looking for. Now I hope he will have the time to complete his project.

>So rather than suggestions of putting a team together
>to work on a new browser, let's encourage this author who is putting his
>own team together now :-))

Right, lets do that.
Thanks the Almighty that Robert doesn't want to implement yet a new TCP/IP stack.

What HD driver do you use? When I tried installing it (a long time
ago) it didn't like ICD Pro Driver 6.5.5 for some reason, and did a
similar thing. It works with AHDI, CBHD, and HD Driver, though.

Hello,
If you don't manage to find it there is alternative software without dongle which can do the same. The name is S(core) P(erfect) P(rofessional) It is a sophisticated note editor with allows beautifull prints of the scores. It has everything a composer/music teacher could wish for. The created scores can be played via a midi keyboard/soundmodule. There is '' a midi step by step" option with metronome which allows you to play the keyboard and see it appear in notes on the screen. It runs on (Mega) ST(e) Falcon and Milan, it never crashes on my Atari's (My PC version does sometimes though)
Available in English too. Still being developped, version 4 is about to appear.
see:
http://www.music-soft.com
You can download a demo version there

Cheers,
Dan (music teacher)

>Is there a Forth compiler available I can use on a stock 520STe??
Yes - there are some PD Forth implementations but don't know if these
include a compiler. HiSoft Forth does include a compiler if you can find
a copy.

>What about Smalltalk? Was Squeak ported at any time?
There are versions of Smalltalk available but I don't know if they are the
full implementation.

>What about a reasonable Word Processor?
Papyrus is probably the best

>Bank account management.
Depends what you want to do - there are some PD programs around - or you
could try to get hold of a copy of Home Accounts 2

>Internet connectivity - email, Usenet.
Shouldn't be a problem

>Small Database systems, Spreadsheets.
Some PD database systems - I prefer Superbase if you can get a copy
Spreadsheets - some PD versions - best commercial one I've used is 3D Calc
but it is a bit dated now.

Wouldn't it be easier to grab the Lynx sources, and use that as a
starting point? Once it is stable, then add graphics support.

Still no javascript though (and Java will probably never run on the
STs).

If your TOS is 2, 3, or 4 (and 1.62?) you can bypass the entire
hard drive by holding down ALTERNATE after the HD light first
flashes. I seem to recall holding down the CONTROL key will
bypass the AUTO folder, but it's been so long since I've needed
to do this I can't recall for sure.

Same experience. He sent me a battey for my TT (I was impressed that
it was the exact one), but at 2 or 3 times the cost of an ordinary
battery. Then the battery failed in under 3 weeks. It was either
pulled from a used machine or simply the shelf life killed it.
He claims the shelve life was the problem. Anyway he did not offer
to exchange it, sell me another at reduced cost, or refund any money.
I was stuck with a battey that cost as much as a mouse. Came to the
same conclusion, no more dealing with Mr. Yu.

I've seen the name "Robert" mentioned but still not sure who
you are refering to. Robert aka "Nevlyn" on IRC? If so
I may of actually tested a _very_ early rendering engine and didn't
relize it was Highwire. I also provided Nevlyn with docs on some
gfx formats and such. Always to glad to help out.

5199. Can't read Atari disks

Newsgroup: comp.sys.atari.st
Date: 2000-04-28 00:00:00 UTC
From: rick_eisner@bigfoot.com
Message-ID: <rick_eisner-1822B6.17100828042000@news.swbell.net>
Source record: 62717

HELP!

I need to find a way to read Atari 520ST disks into a Mac or PC.

My disks work fine on the Atari, but on the Mac and PC they appear to have only 56K of readable space, and no files on them. I've tried several machines, and could not find a way to access them.

I've also tried NoSTalgia 0.65 PPC, but it would not read in the disks. Nor would DUST 1.0.4 read in the disks.

I may not be using these tools right, or they may simply not be the right ones.

Can someone give me some assistance, PLEASE!!!

Rick

That's only partially true.

Most freeware browser sources can easily recompile on MiNT.

Here, I often use Links (a Lynx clone that handles tables) and it
compiled right out of the box. Sure, this is a CLI browser, but
the sources could be used as a starting point for a GEM browser.

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with the NewsGroups.

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

> >
> Hmmmm....IE crashes on me much more than Netscape, though Netscape has
> its bad days too....

IE seems pretty stable on my home machine (Win 98SE): in fact I can't remember it last crashing (he says tempting fate).

At work (NT4) I used to get frequent problems with Netscape (our place's standard browser): display problems, crashes, lockups etc etc. Since switching to IE as my main browser there too, things are a *lot* more stable. On some of our older Win 3 machines running Netscape 3 or Gold we've had problems with hard drive corruption due to Netscape crashing. That, and the dreadful CSS support which is giving me fits trying to develop a new (and accessible) web site, gives the thing a BIG thumbs down as far as I am concerned.

Anyway, this is getting way off topic. To try to bring it back on topic, does anyone know if Mozilla is likely to be any better? If not, then I suggest that it would be a bad choice as a basis for a new Atari browser.

What about the W3C test browser (can't remember what it's called now - used to be Amaya, I think)? Is that open source? What I'm thinking is that at least it should incorporate W3C standards like CSS.

TTFN

>
>I sure hope the old CodeHead guys don't crawl out of the wood work
>and attempt to sue over the name "Hotwire". ;-)

I posted about this a couple of days ago, pointing out that it is in fact
called "Highwire" - so no problem there from the codehead guys I hope ;-)

I am also surprised to see that none of the follow-up postings on this
thread have mentioned this new browser. Perhaps too many Atari users
think any promised software these days is vapour-ware. I am sure that is
not the case with "Highwire", and certainly the author is actively
working on it now. So rather than suggestions of putting a team together
to work on a new browser, let's encourage this author who is putting his
own team together now :-))

Cheers

Paul

Then they should contact the programmers of the current browsers (LoA,
WenSuite, Highwire). Building these features into CAB would certainly
mean to re-write almost every part of CAB (at least a new rendering
engine). And no one (except Alexander) knows how well documented the
CAB source code is.

Of course I hope that I'm wrong but volunteering is much easier than
actually doing it :-(

Matthias

Hi

I've just been asked how you can cancel the Auto-Folder from running
when booting up an Atari.

If anyone knows then please post the answer

Thanks...

Hi,
Please check out my auction for Mercenary (compendium edition) by
Novagen for Atari ST.

http://cgi.ebay.co.uk/aw-cgi/eBayISAPI.dll?ViewItem&item=315179142

This is the highly sought after Compendium Edition of the Paul Woakes
classic game. You get both the first game, Escape from Targ as well as
the follow up, The Second City.

But this is the ultimate version for all fans of Mercenary. You get the
game disk, the 27-page Interlude on Targ novella and instructions for
the ST edition.

The real gems included are the classified blueprints for several of the
hangars and a comprehensive tourist guide to Targ Central City (both
issued by the Palyar information committee). These large sheets are
packed full of invaluable info to help you with the game.

Thanks,

Keith

It definitely does. It produces a really clean HTML too. I have
recommended it to many ex- Front Page users with great success.

<sarcasm>
Of course, better sleep below a bridge than abandon a computer program
you've once written ...
</sarcasm>

I sometimes really wonder if all you claiming Alexander is a "traitor"
who has "abandoned" the Atari community make your living by just sitting
around, doing nothing. If so, this is nice. I, for my part, as well as
Alexander, have to work for money, though, and after some eight to ten
hours of work I rarely feel like sitting in front of my Atari and start
programming (especially as I've already been sitting in front of a
computer all day long).

This does not mean Thing is dead, btw. But I can't judge when the next
release will be finished. The main problem is that there are some really
difficult and/or expendable (if that's the right word) changes to be
done, which I've not yet found the will to start with.

Ciao

Thomas

> Edward S. Baiz Jr.
> (Gamer)

I hate to say it, but it does make sense. One is a means of making
money, the other is means of supporting a hobby community.

Some of the hobbyists have money, most are fickle, and almost all go in
no particular direction, and are individually choosey about what they support
when people do try to contribute to the scene.

As much as I would like to believe that there is a fun hobby feeling to a
computer group of people and that people are dedicated to an innovative spirit
of what created a system...

...the truth is, computer were created for little more than money, and
most computer companies abandon a computer 6 months to a year after production.
The users are then left with second and third party vendors to support then
while they are still paying off their computer loans, and the user form a near
religious click to assure themselves they bought a good product.

Meanwhile technology marches on, and so does the money.

This is not a simple cable but other electronics. I doubt that you'll
find any documentation since all these adapters were (the LINK97 still
is) commercial.

Message-ID: <8efbtibef1@plutonium.compulink.co.uk>
Source record: 62647

Just to say that an early beta version of GEMTrade v3.0 is now available at:

http://www.cix.co.uk/~mark_wherry/index.html

The main change at this stage is the inclusion of the new dictionary, which also adds French into the fun! :-) Though bear in mind that while all possibilities are implemented, German->English and German->French are the ones that work the most effectively.

While this has not been thoroughly tested, it seems to work OK under MagiC PC 6...

If anyone is interested, please continue the thread or email me and let me know how you get on...

Mark.

Thanks for the upgrade. It works fine going from German to English. I
have not tried the French end yet, but soon will. The only small
problem comes when using Gemtrade as a module in Cab. How do you set
Gemtrade to work with German of French websites with manually doing it?
If I set it to work with a German website and then go to a French one,
Gemtrade still trys to translate the website from German to English.
Still, much congrats on your efforts. I do not mind the manual setting.

Yes, it happend to me some times :(
It is a problem of Okami - it can't cope with very big attachments.
In such a situation I used to decode attachment with an external
program MUNPACK.TTP. It is possible because I am retrieving mail/news
in UUCP mode and my MAILXXXX.ZIP and NEWS.ZIP files are not deleted
from my harddisk.

: Try Opera (http://www.opera.com/) or (when it is finished)
Mozilla.

Tried Opera. It wasn't up to IE5's standard and features. Sorry.

: Nice yes, but memory/disk space-hungry and buggy (compared
e.g. to Opera).

In my opinion Opera is not yet finished, nor mature. Netscape is like a Frankenstein's Monster. Buggy, ugly, and incompetent. It also crashes more than IE5. Disk space is no argument today with low prices for harddisks.

: All things Web: yes, all things Internet: no. AFAIK there
: are plenty of news&mail readers, ftp clients, web/ftp servers,
: terminal programs, etc.

The TCP/IP stacks and protocols aren't up to standard. No CHAP protocol exists on TOS or MagiC. Even if there are good email programs they fail use-wise because they're not integrated to, or cooperating with, a good browser.

: Then why buy a Milan if it is used to run some *nix clone?

Beats me. But people obviously do buy Suns, HP:s (with Unix), Linux-PC:s etc. Nothing would stop the Milan from being equipped with both Linux and MiNT or MagiC at the same time. Maybe Wintel haters would buy it for "racial purity"? (No Intel and no Microsoft).

You may format a disks with "DOS-Format" and copy the files to this disk.
But there is a bug in older TOS's, so they don't format "DOS" correctly. I
think it's TOS < 1.04?!?

> I've also tried NoSTalgia 0.65 PPC, but it would not read in the disks.
> Nor would DUST 1.0.4 read in the disks.

No way - try "DOS-Formated". The hardware can't read the ST-Format.

> I may not be using these tools right, or they may simply not be the
> right ones.

An other way to "read ST-Disks" is to image the disks on the ST and read
the images in the PC with your emulator. Pacifist does this for you. The
problem is: I don't know any program to image a disk with your Atari ST.
:-(

The only Intel chip on there is the PCI south bridge (north
bridge being a PLX device, since the CPU is not of Intel
architecture). The other main chips are the 68040, MFP, and
custom logic, which is contained within Lattice GALs.

From: mb@gem.win.co.nz
Message-ID: <Ftrl38.A9@gem.win.co.nz>
Source record: 62730

Can anyone advise what is a suitable program to run on the Atari Falcon to play 44.1 KHz AVR format audio files at the original pitch, without converting the sample rate, by utilising the Cubase Audio Clock or FDI interface attached to the Falcon as the clock source?

Also a program to encode audio files into the MPEG audio layer 3 format (not layer 2).

Any advice would be appreciated.

Are these game disks or data disks?

You must be aware that most 520STs had single sided floppies, which are not readable on most PC's whatever you do.

Try GEM Explorer from www.emulators.com

AFAIK, you can't play at 44.1KHz without an external 44.1KHz clock.

Haven't had any problems with MiNT-Net yet, atleast not after I figured
out how it works (took me about two months I guess...).

> programs they fail use-wise because they're not integrated to,
> or cooperating with, a good browser.

Integrated how? When I clik on a mailto:-URL in CAB, aMail is started with
the mailto-dialog partially filled out, when I click on an URL in aMail
CAB is started. Works rather nicely here.

> Linux-PC:s etc. Nothing would stop the Milan from being equipped
> with both Linux and MiNT or MagiC at the same time. Maybe Wintel
> haters would buy it for "racial purity"? (No Intel and no

The CAC and FDI *are* 44.1KHz clocks (actually, the CAC also comes
in a 48KHz version, and the FDI can generate both frequencies).
Real-time sample rate conversion is a doddle with the DSP, but
introduces audible artefacts.

Aniplayer is a very good player, perhaps overkill for only AVR
but it also does AIFF, MP1/2/3, WAV and a gaggle of video
formats, too. It can utilise external sample clocks, external
D/A convertors (Line Audio Jam/FAD, SoundPool FA 4/8), fast RAM
(streaming A/V data to playback buffers in chip/ST RAM on the fly),
and the direct from disk audio even works on STEs (listening to a
35Mbyte audio file from my Mega STE as I type this).

Zero-X, the commercial sample editor will also do what Mario
requires, but again, could be overkill if the other features
aren't needed.

Shiuming Lai

> Yes, but can you tell me how to do it. I have two free Internet accounts
> here. One uses PAP and the other CHAP. So far I haven't succeeded to use
> then.

It's not difficult at all, this is how I do it:

/etc/ppp/options:

/dev/ttyS3

/etc/ppp/options.ttyS3:

```
115200
crtscts
connect "/usr/etc/chat -v -f /etc/ppp/chat-frisurf"
defaultroute
user jo-even
noipdefault
asyncmap 0
-mn
```

(The last three lines are probably not needed in most cases.)

/etc/ppp/chat-frisurf:

```
ABORT 'NO DIALTONE'
ABORT 'NO CARRIER'
ABORT BUSY ""
atz OK
atm1 OK
atdt81545500 CONNECT ""
```

And now the important part, /etc/ppp/pap-secrets:

```
jo-even * XXXXXXXX
```

(XXXXXXX is the password).

As you can see you simply have to add the user-line to any of the
options-files (~/.ppprc, /etc/ppp/options, /etc/ppp/options.DEVICE), and
your username/password to pap-secrets.

I have not tried CHAP, but it's similar to PAP except that the
user/password is stored in /etc/ppp/chap-secret. Both files use the same
format. You may have to add "+chap" to /etc/ppp/options.DEVICE to use CHAP

instead of PAP, but I don't think this is necessary unless you have both
PAP- and CHAP-accounts with the same username.

there.

: Haven't had any problems with MiNT-Net yet, atleast not after
I figured
: out how it works (took me about two months I guess...).

I stand corrected. Two months implies that it's very
complicated, or that someone's being intellectually sloppy?

;^)

: Well, even the Milan has Intel-hardware ;-)

I know about the PCI bridge chip in the Milan. I hope I showed
that I'm NOT biased *against* Intel or any other company
whatsoever. The evaluation of products and companies should be
heavily leaning on merit instead of misplaced loyalty towards a
logotype.

These are the first questions to ask oneself when considering
various systems:
Is this hardware doing it's job reliably?
Do I like the look and feel of the available software?

There are of course other factors too that bear weight:
Am I willing to pay XXX money for this?
Am I willing to put in the time and effort that is required to
accomplish this goal or service I want?
Do I get access to a "killer application" on this system that
other system's can't match (prestanda wise or costwise).

Just to be a bit positive I can mention that I very much like
the possibility to make one-disk "lifeboats" on the Atari. I
have a single HD floppy with STing and MyMail for my ISP and for
use on my Falcon. It also contains the switch-on program for the
built in Nemesis and a setup that enhances the output to my Sony
monitor (with Centvidel). I have compiled similar one-disk
setups for transforming a 520ST into a faxmachine, an entirely
silent wordprocessor, a TTY terminal for a Solaris server and so
on. A couple of years back I managed to cram in an entire web

browser (CAB) onto one HD disk.

It is obvious that the right approach to develop newer and better computers today isn't in saving RAM or disk space. The bigger, the better.

And again, the single most important piece of software today is an up to date browser, that will process Java and everything else found on the web. If that means we'll need sumo wreslter sized systems, then so be it.

Is there any type of program that lets you turn a sound file
into a ***.PRG which would run standalone? There used to be a
sample of HAL from that Kubrick movie which you could put into
your AUTO folder and run at startup. It would then say something
like:

"I am fully operational and all my circuits are functioning
perfectly"

A fun way of starting up your system. Only problem was that this
sample left some kind of garbage behind and made the computer
crash dive later.

There are plenty of samples on:

www.moviesounds.com

And this Austin Powers one is among the funnier:

swedish.wav (386K) Here is the Quicktime clip of this scene!!
shagp.mov

Quartermaster Clerk: One Swedish made penis enlarger pump.
Austin Powers: That's not mine!
Quartermaster Clerk: One credit card receipt for Swedish made
penis enlarger...signed by Austin Powers.
Austin Powers: I'm tellin you baby, that's not mine!
Quartermaster Clerk: One warranty card for Swedish made penis
enlarger pump...filled out by Austin Powers.
Austin Powers: I don't even know what this is! This sort of
thing ain't my bag, baby!
Quartermaster Clerk: One book...."Swedish Made Penis Enlarger
Pumps and Me: This Sort of Thing is my Bag, Baby!", by Austin
Powers.

Comment: These pumps really do exist, and they're even
recommended by the government's organization for sexual
education and information (RFSU) here in Sweden.

MG

(I know someone will ask, so I'll reply in advance: No, I don't

Euch, what do you call very big attachments?
As test I extracted a 11.8 MB Mime decoded mail with Okami. No problem
whatsoever.
No, the problem is most likely nested multipart messages. (multipart
message inside multipart message). Okami can't handle this yet.

>In such a situation I used to decode attachment with an external

Such banks shall be promptly scolded. Better yet, take your
business elsewhere and tell them why. After too many complaints
and too much lost busniess, they might start to understand the
"any browser" concept. I did that and my bank suddenly became
highly cooperative and made sure CAB was okay with their admin.

This reminds me of what Robert Moog once said:

"I could buy a japanese car which requires little gas and is very
comfortable, or I could buy a bulky, thirsty Chrysler. The choice
is a no brainer. You might say Buy American! but if I don't put
my money where my mouth is, Chrysler will never get it."

That's Opera 3. Try the latest one, it's a lot better. It's not as good as
MSIE, but it'll also give you a lot less problems.

5262. Re: Atari disks on PC

Newsgroup: comp.sys.atari.st
Date: 2000-04-30 00:00:00 UTC
From: Ian Numan <iannuman@netspace.net.au>
Message-ID: <390B8947.A4B6F71B@netspace.net.au>
Source record: 62658

Thanks for all the info everyone has sent.
I agree that it is probably the actual disk drive and maybe the motherboard/bios,
but but here's something that I tried yesterday.

There's a lot of info about PC's not being able to read Atari disks formatted
with TOS <1.4.
I dusted off my old Atari STFM which has TOS 1.0, booted it up, formatted a disk
and copied some files to it.
I then put the disk into my Pentium 90 and logged the disk in Windows Explorer,
I was expecting some sort of error message saying something about the disk not
being formatted, but no, it logged the disk and displayed the files.
Eeven double clicking text files would load them into Notepad.
So I quess my Pentium 90 has a disk drive and/or motherboard/bios that will read
formatted disks from TOS 1.0.

Now I'm confussed.

Well, I downloaded Amaya (Win 95/98 version) and I must say it is a
huge disappointment. It's quite a limited browser (eg no frames, not
that this is a great loss, mind) and the editor is very buggy (for
example, inserting an image just doesn't work and seems to render the
program unstable). I have crashed this program more times in the last 24
hours than anything else I've ever had on my PC (and that's saying
something). This despite it only being used for about an hour total -
and I've uninstalled/reinstalled it, not believing it could be quite so
unstable first time round. Wrong!

Would I be right in assuming that this is something to do with the
Windows version?

> > Still no javascript though (and Java will probably never run
> > on the STs).
>
> Javascript works fine here.

Which browser are you using for this? Amaya seems to have no JavaScript
support in the browser, though the editor lets you enter it.

Hi!

I read in Atari COmputing #12 that a shareware program called double2 is available to allow a high-res screen in STe's. Do any of the CD ROMS out there have it, or where can I get it off of a site?

Regards,

Jim W. Krych

| Well, a friend of mine set it up the first time, so I really didn't have
| to understand anything until I changed ISP. It's really not difficult, but
| it helps if you understand the unix philosophy.

I admit to being sloppy lately because i have other things to worry about.
|
|
| PC-hardware is the cheapest you can find, so the answer to this is pretty
| obvious.

Being the last hold out in Niagara-on-the-Lake I concur as the ppl
I most colaborated with left before I did, one to a Mac
the other ATX. I was also fool enough to be one of those
to camp out for a deal [under one grand CDN] for an
AMD unit at the local big box.

Even the president of my former Atari User group went Wintel
two years before I did.
|
| > Am I willing to put in the time and effort that is required to
| > accomplish this goal or service I want?
|
| Usually most things can be done fastest and easiest on a Wintel-box.

sad but true with a lot of the stuff being give-a-ways, with no
local Atari users to connect with I got assimilated
[see Star Trek in Sound and Vision,

http://www.stinsv.com

and see their lists of startup screens.. the one that has
MicroBorg '98 is the one I see at each bootup]

|
| > Do I get access to a "killer application" on this system that

Bonjours,

Pour ceux qui ont des problemes, ou sont effrayes de MiNT.
J'ai fait un sh script pour mintnet installation pppd.

C'est tres simple, demande quelque questions, et peut avoir different ppp
account que vous pouvez changer tres facilement de l'un a l'autre.

C'est en anglais (je peux le traduire en fr si ca interresse).
Il vous faut un mint/mintos environment deja mis au point (kgmd, taf etc),
genre, sh, grep, ps, ls etc.

Ca s'apelle ezppp et c'est sur http://yescrew.atari.org

> bother uprgading old Atari dogs ?

Hey, Artur! Good to see there are still some ST freaks in the Lower
Mainland here. =)

There are quite a few options for upgrading ST/STEs and Falcons..

For the ST/E:
* PAK68/3 boards (16?MHz 68030+FastRAM, http://www.wrs-online.de/)
* Veloce+2 (16MHz 68000--not sure where you can find these)
* HyperCache030 (MegaST only? and rare..)
* some DIY accelerator hacks (16MHz 68000+cache circuitry,
http://vezz.freeweb.org/)
*

As for the Falcon:

* the Centurbo II; 68030 & 56001 DSP at 50MHz + FastRAM
For some people, the most stable, but not for others--this is a
whole other thread, http://www.centek.fr

* AfterBurner040
An 040--in general, sounds like it's trickier to get working than
the CT2..

* the SpeedResolution Card (36 or 40MHz CPU accel., 32MHz system bus)
I have a 36MHz version here.. =) $80CDN)

* Nemesis
(can anyone out there suggest a good Nemesis resource page..?)

* DIY hacks.
(36MHz 030, faster FPU.. lost the URL, but it's out there somewhere)

* the "Millenium Falcon Accelertor" (groan!! =)
Though I've been cruising around for Falcon/speeder pages like mad
since October of last year, I only just discovered this one! Looks
like it's been untouched for three years but it's still worth taking a
look at: http://www.cix.co.uk/~fdc/html/falc2000.htm

Cheers...
Derek

Which STing version are you using? You really must use the latest one (v1.22)
Furthermore and probably your problem you must use
'chapelie.rma.ac.be' as address, thus without the leading ftp://
The ftp:// address is more for browsers and modern ftp-clients.

If anyone is interested in buying a Falcon 32 megs of ram, CenturboII board (installed) but not working
with a 200 meg ide hard drive then please let me know.
The computer worked fine until I had my CII board installed. It came back from chromagic and would not start
any applications (only two worked the others all crashed) rudolphe at centek told me it was the board.
I shipped it back to him and he did something to it and sent it back. I plugged in back in turned it on and
wella NOTHING!!!!

I have come to hate this machine...It greives me to say I love Atari!!!

the freaking thing has caused nothing but heart ache. Since then Im on a new 550mhz P3 128 megs of ram running Calamus 99. It's like driving a vette.

If you are interested in the equipment please let me know and Ill get back to the highest offer. And if no one offers then Ill gladly place it in my trash compactor and watch it crunch!!!

Thanks fellow Atarians but after playing with the likes of PC (programs like illustrator or picture publisher 8) theres no looking back.

OHHH ok ill keep using my ste. but thats it!

thanks for everything, all the great times

Im outta here

Yes, there is Ghostscript and GEMGS (adds a GEM front end for easier handling). The latest version 1.3 is available from Derryck's home page http://www.cix.co.uk/~derryck/index.htm

Be warned that it is very slow on the Atari, and the previous version at least tended to crash on odd pages, specially in large documents, both when viewing and printing. In the latter case you usually have to start again from the beginning.

If you can borrow a PC or Mac and use Adobe Acrobat (written first for the Mac, I believe) then you are likely to find that easier.

Regards, /Peter/

>whatsoever.

It is a problem with import operation, not decoding - IMO.
I couldn't read messages with attachments bigger than (approximately)
1.2 MB.
I suppose the reason of the problem is not sufficient free memory on my
MEGA 4 STE.
How big is RAM in your Hades?

>No, the problem is most likely nested multipart messages. (multipart
>message inside multipart message). Okami can't handle this yet.

The attachments to the mail I couldn't read, were single JPG's.

>If he save the whole message (save to) he can use munpack.ttp too.

He have to save message *before* import operation!
When importing, a body of the message is lost and only a part of the
attachment is imported as the message.

Hi Lyndon,

LA>Anyone know if there is a PDF file viewer for Ataris?
Yeah, there is GEMGS 1.3 (realizes Ghostscript 6.01) by Aladdin
Software, Atari port by Christian Felsch.

I put it into 'Maus SU2' (BBS +49-2241-946209). It's about 1.5 megs
the fonts omitted...

I had downloaded the archives from a ftp server of 'Technische
Universitï¿½t Harburg', but forgotten the server's exact name, sorry.

Maybe Christian's email address could help you: felsch@tu-harburg.de

Hi there,
Got your message, and since I hate to see a Falcon get crunched, I'll lay the safety webbing for the Falcon with an offer of $25 (plus whatever shipping comes out to be)
This is mainly just in case nothing else is offered. Little tight in the savings area, and don't know much about electronics, but I would pay that to save the machine.
I'm certain someone will offer more. :) .
Sorry for your experience, and please do hang around with us. If you would like a working ST, if nothing else to recover documents from the ST world, this too could be discussed. Take care,
Doctor Clu

bought the first Gemtrade at a Stafford show and use it as a fast real time module for CAB. I find v 3.0 almost unusable as a French to English translator on my Milan 1% per min at most, and
German to English is also slower than old version. What's wrong??

Just a quick test so far, but the same bug as the earlier version when used as a module in CAB. A zero-length file named <blank>.ENG is created in the Modules folder and my Falcon then crashes completely.

Falcon/CT2/MagiC6/NVDI5

But unfortunately a truckload of spelling mistakes come with it, i'm compiling a list at the moment, words like 'removesed' crop up, actually quite a few of them are 'sed' words, 'rearrangesed' is another 'functionsed' is another, i'l list any i find if you wish, maybe these clues will help you track the problem.

I discovered these whilst translating the Jinnee dox for a read.

As said in a previous posting Gemtrade v 3.0 beta works just fine be it as standalone prg or as module for Cab. It works very fast on normal TOS or (MiNT) VFAT partitions BUT on an ext2fs (Linux) it's deadly slow.

Don't foget though, if you're a demo/games freak (like me!!) then (esp the demos) will be incompatible once the machine is upgraded. I've left my new Atari STe alone (it's a bog standard 1mb STe with TOS 1.62 - the most compatible) and find this much better.
I'd prefer one of the upgrades mentioned for the Falcon below, but (1) I can't afford it atm, and (2) I'm wondering if the zillions of Falcon demos I have will suffer the same fate as my first upgraded STe?

What doe you mean, Pascal? Didn't Okami import the message properly?
That could be due to insufficient RAM. For multipart messages, Okami
needs twice the size of the message in RAM.

It can, Krzysztof, we talked about this before. But you don't have
enough free RAM to import megasize multipart messages.

Not with the latest beta version, Krzysztof. If there isn't enough RAM
for the operation, the message is not imported at all.

Note that the pre-compiled binary avaiable on Juhani Sivusalo's
page was compiled with a 64-bit library. Changing the library
for one compiled to support 128-bit or better is easy.

Also, Howard's code fails to recompile, using MINTLIB 0.55, even
after the includes' paths are corrected.

Anyhow, I just hacked my browser/agent string using Qed:

Mozilla/3.0 (compatible Atari CAB/2.80 MiNTnetOVL/1.84 SSLeay/0.80)

Rename CAB.OVL to CAB.PRG, before you hack the binary!!!
(rename it back after the editing is done)

Keeping all binaries mc68000 compatible to accomodate the few
remaining ST users is partly what drags the Atari platform, right
now. From now on, we should only support 68020 and up.

That's true, AFAIK he hardcoded it to use some undocumented features in an
old version of MiNTlibs :-(Also, it's not compatible with later versions
of GEMlib.

> Rename CAB.OVL to CAB.PRG, before you hack the binary!!!
> (rename it back after the editing is done)

Why? Can't you just use "Open binary" in QED? Works fine here.

Hi Thomas,

>I sometimes really wonder if all you claiming Alexander is a "traitor"
>who has "abandoned" the Atari community make your living by just sitting
>around, doing nothing. If so, this is nice. I, for my part, as well as
>Alexander, have to work for money, though,
What bullshit is this?
This might come as a shock to you but most of us if not everyone here has to work for his living. Perhaps you think that we're just a big bunch of rich spoiled people who haven't got anything else to do all day other then sitting here reading this crap, laughing ourselves to death with those unfortunate programmers? someone once said that programmers are a different breed, I tend to believe him after reading your drivel'...

>and after some eight to ten hours of work I rarely feel like sitting in
>front of my Atari and start programming (especially as I've already been
>sitting in front of a computer all day long).
If I understand this correctly you are trying to tell us that programming CAB or Thing on a Atari is very difficult after a days work, but programming iCAB after a days work on a Mac is fun?
Sorry, but my simple mind isn't able to grasp this..... :-/

><sarcasm>
>Of course, better sleep below a bridge than abandon a computer program
>you've once written ...
></sarcasm>
The point is that he hasn't abandoned CAB at all, he just decided on a blue monday not to support it anymore for the Atari platform. How could he possibly

abandoned it? CAB 2.8 is only a couple of months old.. While he was already working on iCAB he was still cashing in money for CAB.. so in a way everyone who bought or updated CAB since february 1999 has helped financing the iCAB project. The latest CAB 2.8 was only released a couple of months ago...are you telling me that he doesn't get royalties from this?
If he takes my money then he has the moral obligation to support his program, and with a little luck in 2001 there will be a legal obligation as well.

>This does not mean Thing is dead, btw. But I can't judge when the next
>release will be finished. The main problem is that there are some really
>difficult and/or expendable (if that's the right word) changes to be
>done, which I've not yet found the will to start with.
Nobody is complaining about Thing.... because of the shareware principle we all know what to expect. CAB however is not shareware....

How about this....
Why does a programmer asks money for a program? I suppose its to make up for the time he has invested while working on it? this is very reasonable, after all nobody likes to work for peanuts...
In buying the program, the client supports the authors work. It's more then just supporting it, it's also a way of giving the author the assurance that his work is appreciated and give him the opportunity to enhance and expand the program further. When buying the updates the client shows his further support and makes sure that the author doesn't starve to death or abandon the program...
CAB along with NVDI surely must be the two best selling programs on our platform, since our platform is very small this is not enough to make a living... but this doesn't come as a surprise does it? Why do you program for the Atari? following your (sarcastic) logic, it's much more profitable to do the same thing for another platform...

<grin>
Is Mr.Claus a genius who sleeps in a proper house in a comfy bed while the existing Atari programmers are morons sleeping in a cardboard box under a bridge?
</grin>

Cheers from Belgium
Dennis

Hi Thomas,

>> Too Bag Mr. Clauss abanddoned us in favor of iCab.
>
>Yes, it's really a shame that he decided to earn some money - he
>could've made his living from just the thanks of the Atari community ...
Thanks ? I can't remember paying Mr.Claus with thanks, looking back at my bank statements I payed his efforts with real money. Has anyone here payed for CAB with thanks instead of money?

Looking back at it, he should thank us.... considering that since CAB 2.5 he hasn't really been bothered about his baby anymore, all the later updates include features with which he has nothing to do...

Why some people here turn this guy in some kind of holy soul goes beyond me, he programmed an offline browser, which thanks to the work of many people is now the best online browser on our platform... he didn't do it for peanuts, he got payed for it... unfortunately not enough to his likings.
Lets hope that the Mac community turns him into a millionaire, but then of course he'll have to work day and night, because the current version of iCAB after 18 months of development still doesn't cut it..... I somehow have the feeling that the Mac community hasn't got the same patience as we do.

In case you think that I've got something against programmers let me assure you that I admire some people as well : Peter Rottengatter for STiNG, Holger Weets for STGuide and Appline, Julian Reschke for SPIN, Thomas Much for SMU, Thomas Binder for Thing and many others who supported this platform through thick and thin over the years, regardless if they could make a living out of it or not, all these people deserve our respect much more than an oppertunist like Mr.Claus

Cheers from Belgium
Dennis

So even the most 'finicky' of demos would still run? I can't say this of
the Veloce + upgrade for the STe (as this limits the 'original' mode by
still having TOS 2.06).

Steve

What you might not know is that Alexander started working on iCAB _for a
living_. I.e. it's what he gets paid for. Might have changed in the
meantime, but it's been so I last talked to him.

Ciao

Message-ID: <390E06DF.DACC00EA@pobox.com>
Source record: 62563

The main problem with keeping up with the 'net's requirements are:
- STs are under-powered for many tasks (video, many large pages,
Java...) and better systems are still expensive
- many file formats require prorietary modules and the platform
isn't interesting for the companies producing these modules
(Real Audio...)

Sooner or later, Atari users who can't run Linux or NetBSD to get
at least some of the features, may have to resort to using something
like VNC and a networked PC hidden somewhere in a closet in order to
browse the web :-/.

I don't mean to offend anyone, but I'd really like to know what it is
that keeps many of you Atari users so attached to the platform:
- the unique hardware?
- The GEM/TOS look&feel and programming model?
- a few good programs?
- The 680x0 cpu? :-)
- you can't afford a PC even though you'd want one?

I was a little bit sarcastic. But I've been told... well... some
programmers write in their docs that they needed to make some
adjustments because of OE. And I've seen some oddities with messages
coming from OE, specially with the Mac version(s).

Bye,

Partly, it's just being perverse. However, I really like the
functional simplicity of the Falcon and ST. I also like the
fact that I can often get in contact with the author of many
software programs. Ironically, there's a bit of me that is fond
of the closed system -- any PC is obsolete and non-supported so
quickly one might as well get one already obsolete.

I have a friend who collects VW beetles. Another adores (and
commutes in) his MG roadster. A third binds his own books. My
Ataris are functional hobbies. I enjoy taking them apart and
discovering what they can do -- the fact that I still do 80% of
my computer work on them is an added bonus!

It also requires plenty of memory, and the bug which results in only a single file
containing the last page of a multipage doc being produced if you print to an image
file is still present.

TC>
TC>
TC> Sent via Deja.com http://www.deja.com/ Before you buy.

Your best bet is to format a floppy on the Amiga side in PC
format. I believe an old version of the utility called Cross
DOS comes with the Amiga. The latest version of Cross DOS is
version 7. It handles W95 long names. Any version of Cross DOS
should do. I usually format under Directory Opus (4.12).
Choose PC0: through PC3:. You'll probably choose PC0: - that's
the built-in floppy in almost all cases. Don't use DF0:!

```
Actually, SOME PCs won't work with SOME TOS disks. It's all very random, but
there must be a pattern somewhere. The rule about TOS <1.4 is from Atari.
TOS 1.4 was the first to supposedly format DOS compatible disks.

> When importing, a body of the message is lost and only a part of the
> attachment is imported as the message.

The sender was kind enough to send me the file again. This time I had unchecked in POPWatch the option to "erase the mails from the server" to track down the problem.

I'm aware that Okami do not handle nested multipart messages but the problem seems to be elsewhere: I first tried to get the attachement via munpack.ttp but it was not correct. I do not understand why but it looks like the problem is with POPWatch :-(.

The good news is that I was able to get the file via the very nice MyMail :-), hence the idea that OE may be the culprit... as usual.

Bye,
/Pascal/

PS: if you answer to this message, and because of the problem with my news server, please send me a copy via email.

Nothing is wrong... well... :-) That's why I said in my original posting that it works best on G->E or G->F, although G->E is the best as the dictionary is currently indexed on the German word.

Becuase the dictionary has grown, a slight decrease isn't unsurprising - how significant is it?

Mark.

LOL! :-) That is an excpetionally good point!!! :-) I will need to add a
language selection dialogue to allow you to choose when it is launched as a
CAB module...

Mark.

On my Hades 060 running FreeMiNT 1.15.6b/N_AES GEMtrade v 3.0 beta when
used as module for Cab 2.80 works like it is suppossed too. No crashes
whatsoever.

128 MB. Hmm, not sufficient memory can be the problem but I don't think
that shortage of memory is the problem of Pascal though. He is using a TT
with IIRC 68 MB RAM.

Have you told this to Jos den Bekker?

>>If he save the whole message (save to) he can use munpack.ttp too.

In the case of Pascal I don't think parts of the message are lost during
import. Ofcourse to play safe he can always make a copy of the import file
and pass it through munpack.ttp, ESSCcode.prg, Marceau or whatever
Mime decoder.

This is probably the biggest reason that i keep my f030 and love the
atari ethos that it is to constantly push our machines to the limit,
demos / and amazing apps like falcamp, and it's ability to get the job
done for all my uni work.
Using a machine which has evolved IMO so successfully against it's limited
hardware and still continues to punch well above it's weight gives me
a nice warm fuzzy feeling :)

"Dan" <aahuls@xs4all.nl> wrote in message
news:957224592-927051AEicMi@xs4all.nl...

: Well a friend of mine contacted Suse about this, better
: he contacted the right person there and the answer was
: that Suse is working on a 68040/68060 compilation, which
: can be used on the Amiga and Apple plaform, but they are
: going to compile a special Milan II version, one which
: only runs on that computer, so not for the Milan I or
: other Atari's/Clones :-(

Excellent news! SuSE is my favourite Linux distribution
for the PC, structured, logical and comfortable. They're
also a *leading* Linux company, in the sense that they
develop drivers and add new system features no one else
has come up with before. Like support for more RAM etc.
For instance, they're the first company to offer it's
distriution on DVD. So instead of six CD:s containing SuSE
Linux, you only need one.

The six CD:s are filled with 1500 prgs, among them
heavyweighters like Netscape, office packs, WordPerfect
etc.

Despite all this it all costs you about the same as a mere
upgrade from MagiC 5 to 6.

This is indeed good news for the Milan!!! It means that
this bird will be able to surf the web and fly like all
the other winged birds out there. With doubled partitions
this means that you'd be able to run two or more OS:s,
just like any ordinary PC can. On the first partition:
SuSE Linux, on the second: MagiC or TOS 7 or whatever. So
the browser Messias we're all waiting for will be able to
relax and crawl real slow to it's far away destination
Javaland. Because we'd already be arrived there on the
other partition...

I've heard a rumor that the folks behind the Milan have
aquired the rights to the Centurbo board, and also to the
double CPU Phenix motherboard. Can we hope for a
continuation of these projects in rebadged form? A
Centurbo for the TT? A Centurbo with integrated SVGA
card? Any comments?

Double MC68060:s (or double whatever CPU) requires much
more of the OS than TOS or MagiC can provide for, but
Linux is ready for up to 8 CPU:s (if I recall things
right). At least on the Intel, Sparc and Alpha platforms.

>> What doe you mean, Pascal? Didn't Okami import the message properly?
>
>Yes but I'm not completely sure that my login.txt was correct: maybe a
>problem with POPWatch or something else.

The only problem with Popwatch I'm aware off is the 'dot transparancy
problem'.

IIRC when a line starts with a dot the Transport protocol (POP3) adds one
dot extra when the line does hold more chars then one single dot. I can't
explain the reason for this behaviour but take from me it's necessary. I
believe it has something to do with the fact that a line begins with one
dot means 'end of message'
Popwatch however doesn't remove that extra dot when it received such
mails.
What you get then is something like that. BTW: to avoid problems I've add
a "| " at the beginning of every line

| . line with one dot
| .. line with two dots
| last line

Popwatch retrieve this as follows

| .. line with one dot
| ... line with two dots
| last line.

As you see Popwatch adds two times an extra dot.
I assume that this behaviour can lead to some unexpected faults.
I've told this once to the programmer of Popwatch but I never received an
answer back.

I think it might be best for both platforms if we stopped trying to make
"all in one" software. That's one of the things that has kept the PC
platform screwed up for so long, tryint to retain too much backwards
compatability. Of course nothing is ever going to give the H/M/F platform
mainstreme respect, but at least amoungst it's enthusiasts it would benefit
them if their software wasn't being held back by the ST. And it might encourage
hobbiests to develope more efficent and powerful software that is dedicated
to only run on the ST.

Personally I don't care much about the Hades/Milan/Falcon machines. I don't
own one, and until one shows up for $20 or less at my local thrift store
I won't own one. My ST works perfectly fine for all my MIDI tasks and that's
all I use my ST for anyways (except for one ST which I use as a VT-100
terminal to access my Lynx shell account).

It would be nice if the ST had the same kind of devoted fanatics that
some of the other machines do. There are more people writing new software
for the old Atari 2600 video game system than there are people writing stuff
specifically for the Atari ST.

For me the Atari ST has passed into the realm of "Nostalgic Artifact" although
it would seem to most people it's simple "obsolete junk". Even amoungst the
Atari community we've seen people ridiculed for continuing to develope for
the ST only.

Perhaps in another 10 or 20 years the ST will gain the hobbiest respect it
deserves and people will try to push as much as they can out of the machine
like hobbiests are doing now with the Atari 2600, Atari 800/400, C-64,
Apple][and other old 8-bit machines. Tinkering with these old machines
has become somewhat akin to hot-rodding classic automobiles with enthusiasts
competing against one another to see who can come up with the most powerful
hardware modifications and the most powerful applications.

But like I said, the ST is too new to have much nostalgic value and too
old to be considered with bothering with.

That's all true. It would be nice to have MiNT easily installed and
maintained like Windows98. Over the last three years, I've slowly built
up a familiarity of where to find Atari things on the net, but I've got
no idea whatsoever how to learn how to work with MiNT and port things to
it, let alone where to find things to port to it.

Well, Edward, the list just goes on and on. With free net services coming out, I'd like to dump my ISP, but then I'd have to use webmail, but can't get into it without Java. Can't even use the free ISP's without a PC. One or two allow a Mac. Like you, can't access my bank accounts. Try to go to MP3.com, and the first page loads, but it crashes on the my.MP3 page. There's just more and more places you can't go with CAB.

The difference is that on the old machines, hobbyists are not trying to get them to do more than what they did back then. With the high end TOS machines we are still trying to get them to do what state of the art competing current technology is doing, and that is where we are starting to fall behind, like being locked out of more and more web sites, or GEMGS falling behind on the PDF specs, or the MiNT X11 server being obsolete for modern UNIX apps.

The ST is fine for WP, DTP, MIDI, but I began to realize its limitations when I went online with it and found that even with pictures turned off, it took 5 to 10 minutes for CAB to format a page before it could display it.

Which is why, as said before, we should just make software for
whatever computer is capable of running it, instead of making sure
everything runs on a 1Mb, No (or very small) HD, 8MHz 68000, TOS 1.0,
ST-Lo/Med/Hi resoltuion ST computer. I even find that for some things
my Nemesized Falcon is a bit slow. So let's start focusing on
software support for the new machines before they die off from lack
of it. There's probably a lot more software already available for the
ST than for the Milan.

Source record: 62520

Atari Users,
As you may have guessed from the subject line I have a collection
of Atari computers to get rid of. All equipment was working when put
into storage two years ago. It has been stored in a cool safe place
since. Aside from the computers themselves there is a box full of Antic
magazines and related Atari materials. It is all yours -- for free.
I would like the equipment to go to somebody who will USE it and
get some use from it.
Basically there is a 520ST, a Mega ST2, an 800XL, the ST B&W CRT
as well as the color. A handmade oak HD case with an ICD card and 50MB
drive. A couple slow modems. Three dot matrix printers, one wide
carriage. A Spectre GCR with Mac ROMS.
It's a whole trunk full of usefull bits for Atari mavens.

Please do not request a more detailed inventory, I don't have
the time to sort it all.
The are only four conditions:

1) Be willing to pickup equipment in Southeastern Mass.
2) or I will deliver as far as northern RI, no more.
3) I will not ship any of it.
4) Lot will not be split up, all or nothing.

There is no cost.
First confirmed e-mail gets it all.

Send email to: atari@lightchaser.com

This is 100% legit. I paid good money for this equipment many
years ago and cannot move myself to throw it all in the trash.

I will answer email only, I do not read this newsgroup.
peace,
J.

Source record: 62521

well Someone called it on 300.00 but I want to give everyone a chance.
Right now Im going to ship it back to Chromagic.
There chris will try to get the CenturboII working and if that cannot be done then he will reintall the old mother board.
It SHOULT NOT sell any higher than 400.00 with a working centurboII and 32 megs of ram.
If we cannot get it working then It should sell from 250.00 to 300.00.
Now ive got the offer for 300.00 but if anyone offers 400.00 for the way it is right now ITS SOLD!

I dont want to play auctioneer.

If I do not get a bidder then it will be sold either for 300.00 (if the old mother board is put in correctly - shouldn't be a problem)

If that bidder does not buy at that time than the 250 in three payments will get the computer.

So if anyone offers 400.00 as it is (I will have Chris at chromagic send the mother board to the same address as my Falcon).

reguards fellow atarians,

Gene

I've heard of a port of Netscape to Linux 68k that runs under Linux on
the Falcon. Don't know where or how to find it, but hear it is too slow.
Would like to try it on my Centurbo though.

Eek! No, the problem's still there. We're in email contact over this, plus I've made
a suggestion re how to choose which language pair to use when used as a CAB module.

Good point Steve! :-)

However... :-)

When people upgraded to NVDI 5 on native Atari system there were reports of crashing. This doesn't happen under NVDI 4, and I have no idea why it happens at all as GEMTrade as a generally clean AES reliant app makes no special calls to the VDI, or NVDI.

I did write to 2B when this was first reported but got no reply...

Mark.

Uwe answered :
And you believe this? I suggest contacting SuSE in order to ask them
about it.

Martin answered :
Don't believe everything what papers says. Remember ST Nieuws:-))

And Dan finally writes :
Well a friend of mine contacted Suse about this, better : he contacted the right person there and the answer was that Suse is working on a 68040/68060 compilation, which can be used on the Amiga and Apple plaform, but they are going to compile a special Milan II version, one which only runs on that computer, so not for the Milan I or other Atari's/Clones :-(

Isn't that great news !

Well, you must "not- not believe" everything :-)

Cheers
Dan

: 68020 and up.

Sounds pretty exagerrated to me. How much of a millstone
is that MC68K code compatibility really? Aren't there some
programs that are specifically compiled for this or that
Motorola CPU? Like those OVL:s for the Falcon, for the TT
etc.

However, you have a point. I tried once to use Ghostscript
on an ST and it was a real pain. It wasn't really fun on
the Falcon either, until tried on a Centeked system.
Digging a big canal requires big tools...

? "A 68040/68060 compilation" seems to suggest
a binary that is compatible with both chips,
which would mean the lowest common denomintor,
the 68040. There are 040 and 060 Amigas, but
Macs finished with 680x0 where x=4, so in these
cases it would make sense for a 040 base version,
yet for Atari they are going to compile a 060-only
version, and only for Milan II?

I suppose the 68040 is not as widespread in the
Atari world as Amiga/Mac, so perhaps it isn't so
strange after all.

It's not. There are quite a few (mainly old) demos and games
that don't run correctly, mainly the music is garbled if they
use DSP interrupt instead of polling the busy bit. A small
inconvenience, certainly off-set by the extra power offered
for more productive use. The only way to guarantee 100%
compatibility is not to modify the machine at all, but
you'll soon grow tired of that. Over 95% of the software I
regularly use and value is fully compatible. Enough said.

In C : simply change a compiler option.

In assembler : are *many* big and time-demanding apps programmed in
assembler ?

I do not see your point here. It is more a system problem IMHO
(supporting later TOSes and such).

Sounds to me what you're really saying is that ASH did not
give a good enough deal to Alexander for him to actually pay
the bills while working on CAB, while people on Mac made sure
to pay him sufficiently.

> - The GEM/TOS look&feel and programming model?
Yes, if running N.AEs with Thing. No, for standard Atari TOS.

> - a few good programs?
Many.

> - The 680x0 cpu? :-)
CPU is irrelevant. It only has a meaning for statistics maniacs
using their brand new iMac or Nullenium for word processing.

What matters are applications:

* how fast they get the job done (number of keystrokes or mouse
clicks, not CPU cycles!)

* how they get the job done is a process that is logical enough
to be immediately put to use (no need to go through 10
unrelated menus to find the correct option).

* it uses standard, documented keyboard shortcuts and OS API to
get the job done; using a new program doesn't invent new key
combinations for Clipboard usage, nor a new GUI that bears
little resemblance with the expected OS appearance, etc.

Here, unfortunately, recent Windooze applications proove that
logic and user-friendliness are alien concepts for coders.

The iMac is an interresting appliance, though. Everything is
made to make you feel like you are using a toaster or microwave,
and this is done in a consistant, OS-wide behavior. However, you
pay twice the price of PC hardware, for what basically _is_ PC
hardware by ATI and other OEM manufacturers. So, no thanks.

> - you can't afford a PC even though you'd want one?
I currently can afford SGI, if I wanted to; this is not an issue.

The real issue is, do all those iMac and Windooze really offer
something I want? The answer is no.

The only thing I really need, at this moment, is for CAB to
support HTML 4, CSS and Javascript.

Beyond that, Atari applications (or freeware ports to MiNT) do
everything I need.

What is your opinion on ports to MiNT? This seems an important part of Atari evolution, but it seems you have to be a UNIX guru or coder to understand this and be able to function in this environment. It is a long way from Sig Hartmann's enthusiasm in 1984 about a new computer that was so easy to use that the owner's manual was only a quarter inch thick.

John

Yep.

Many are optimized for 68020 or better, yes, and this CPU
specific approach is a raising trend in the freeware world.

> I do not see your point here. It is more a system problem
> IMHO (supporting later TOSes and such).

Well, supporting TOS versions prior to 2.06/3.06 is a drag too;
too many dumb bugs that you have to check for.

> What is your opinion on ports to MiNT?

They generally work better than their GEM counterparts and are
more closely integrated to the OS calls, because MiNT supports
most POSIX functions expected on any other UNIX.

GEM applications, nowadays, fall into two camps:

* heavily optimized, flashy, MagiC-specific wonders.

* generic GEM applications that get the job done, but
are less flashy because they need to work on any and
all possible TOS variants (TOS, MultiTOS, Magic) and
on all TOS versions, including those prior to 2.06.

> This seems an important part of Atari evolution, but it seems
> you have to be a UNIX guru or coder to understand this and be
> able to function in this environment.

Not really. I am far from a UNIX guru; I just tend to use more
and more commandline than before.

Fo example, let's say I need to copy a whole bunch of files from
an FTP site. Two possibilities:

* aFTP

Open a connection, change to the correct directory, select the
correct files, download, move to the next directory, etc.

* wget

Two options:

* Recursively download the whole directory (wth a specific
number of sub-directory depth) in background, then sort
it all later. Really quick.

* Provide a list of specific files to download, from a varied
list of directories on different hosts. Let it fly in the
background.

> It is a long way from Sig Hartmann's enthusiasm in 1984 about
> a new computer that was so easy to use that the owner's
> manual was only a quarter inch thick.

True, but how many applications were being used back then?
You had your word processor, which could output basic text
styling like italic/bold/underline; you had your DTP thing
which was years ahead of the current PC tools, you had the
music software. Period. Those were the main usages.

Nowadays, with internet applications, scripting languages that
are too numerous for your hands to count, HTML, XML, multimedia
and the whole internet thing, find me one machine whose usage
would be simple enough to have a manual less than one inch thick.

Hello Steve,

Don't bother to compile a list of these spelling mistakes. The problem
has been identified (and will hopefully be corrected quickly ;-)).
'removesed' should read 'removes\ed', 'rearranges\ed', 'functionsed'
should read 'functions\ed', etc. The '\' is there to indicate the two
possible translations.

Could definately agree there, and I am a 1040ST user. :)

Hey, I'm impressed that the Atari platform has all that it has for the
68K support. People talk making the CAB source code available for further
development. Hell, I would like it so that one day the low end mac community
might have a Browser that can be used on the 68000 Macintoshes.

We haven't done bad for a community. I would like to see it progress...
you have at least my blessing to support actually 68030 and above only from now
on.

If nothing else, when I get a higher end Atari again (Hades, Milan,
accelerated Falcon, etc...) I want it using the best of it's ability. :)

It is refreshing to see a mere user understand the point.

> If nothing else, when I get a higher end Atari again (Hades,
> Milan, accelerated Falcon, etc...) I want it using the best
> of it's ability. :)

This is indeed the idea. Processors since the 68020 offer some
additional tricks that can run certain instructions in a more
efficient way than on previous m68k chips.

As discussed elsewhere, in a previous thread a few months ago,
the main difference between the 68020 and 68030 is very small.
Also, some "experiments" started on the 68030 were dropped, so
the 68040 and 68060 are more like successors of the 68020.

Because of this (and the fact that an STE upgrade uses it), the
68020 therefore makes sense as a base support level.

Good but expensive.

DW > * AfterBurner040

F030+AB040+graphics card is great, but IMHO better (and cheaper) is
to buy the Milan. AB040 without graphics card is only an "Fast
standard Falcon" ;).

DW > * the SpeedResolution Card (36 or 40MHz CPU accel., 32MHz system
bus)

No ! Only 16/18/20 Mhz for BUS and people heve usually big problems
with this old speeder.

DW > * Nemesis

Very good, but sold out for some years and never produced anymore.

DW > * DIY hacks.
DW > (36MHz 030, faster FPU.. lost the URL, but it's out there
somewhere)

Obsolete, slow and buggy!

DW > * the "Millenium Falcon Accelertor" (groan!! =)

Only wapourware, I think...

So, I know some other speeders:

FX card - I hate this card, because most people have only problems
with it.

Phantom - this is my speeder :-) Try http://www.volny.cz/phanatic/

DDD, SKUNK - VERY obsolete !

Bye,

Ctirad

JOYSTICK Epyx hand conformed joystick $ 3

JOYSTICK sold as set: 2 Wico hand-formed joysticks, 1 in perfect condition, 1 sticks a little $ 1

MAGAZINES great deal! 53 USA Atari mags, 1 Atari disk all together in one super cheap set! email for titles, shipping not included $ 6

MEGA STe computer 16Mhz 4MB RAM, 300MB+ internal hard drive, HUGE PRICE REDUCTION - was $425! everything works, Great computer with BIG hard drive $252

MODEM EXTERNAL 1200 baud Atari classic, AC adapter, great starter modem for older computers, incl phone cable, serial cable add $5 $ 6

MODEM EXTERNAL 1200 baud CapeTronic w/builtin AC adapter & volume control, great starter modem for older computers, incl phone cable, serial cable add $5 $ 6

MODEM EXTERNAL 1200 baud Packard Bell, AC adapter, great starter modem for older computers, incl phone cable, serial cable add $5 $ 5

MODEM EXTERNAL 2400 baud GVC, AC adapter, great starter modem for older computers, incl phone cable, serial cable add $5 $ 13

MONITOR Master switch between color & mono with a flick of a button! $ 3

MONITOR color Atari SC1224 minor problem: the power button switch won't stay pushed in unless you hold it; fix or replace with a switch from Radio Shack; otherwise works perfect with great picture $ 15

MONITOR color Atari SC1224 working $ 30

MONITOR color Atari various models working $ 30

MONITOR mono Atari various models dead $ 12

MONITOR mono Atari various models working $ 26

MOUSE Golden Image optical mouse, no ball, super light, amazing mouse! $ 1
minorly broken, button sometimes works and sometimes doesn't, and it often
doesn't want to move right; comes with special gridded mouse pad

MOUSE original Atari mouse guaranteed working $ 9

POWER SUPPLY external for 520 ST's $ 14

PRINTER SUPPORT STAND 2 plastic legs to hold printer above paper, best $ 2
with larger dot matrix printers, sturdy smokey-clear plastic

PRINTER SWITCHBOX Pengo 25-pin for modems or printers $ 10

ROLAND D-50 Synthesizer, great condition classic synth, includes MIDI $504
cables

SPECTRE GCR the premiere Macintosh emulator - complete and upgraded with $ 21
ROMS (disk/docs/cable)

ST/IME internal clock/calendar from Zubair Interfaces Inc, sets your $ 13
clock automatically every time you boot. Incl box, software and hardware.
Suggested retail was $57.95. Brand new. No guarentee on lithium battery
(estimated 10 year lifespan)

SW ADVANCED Art Studio paint program from Rainbird (disk) $ 1

SW AEGIS Animator animation generator and viewer (disk) $ 1

SW ASSEMPRO assembly language compiler (disk/docs) $ 1

SW BALANCE Of Power strategy game; manual needed (disk) $ 1

SW BATMAN game based on 1st movie by Ocean - fun! (disk/docs/box/sticker) $ 3

SW BENTLEY BEAR Magical Math II, educational, published by Atari (disk) $ 1

SW CRACK'ED game published by Atari (disk) $ 1

SW CYBER Studio Set - hundreds of dollars of great CAD/paint/render $ 16
software! cyber paint v2.1, cyber mate v1.1, stereo cad-3d v2.02, cad-3d,
plotter & drivers, human design disk, cartoon design disk, cyber control
(disk)

SW DAC Easy Accounting software 2disk (disk) $ 1

SW DEGAS Elite - brand new! original disk envelope is unopened! $ 5
(disk/docs)

SW DIAMOND BACK 2 great backup program to most any media (disk) $ 1

SW DR.T's Roland D-50 Editor/Librarian, synth also available see below $ 22
(disk/docs)

SW DUNGEON MASTER includes Secrets of Dungeon Mastery book, considered by some to be the best ST RPG game ever! (disk/docs) $ 1

SW EKG Teaching By mad scientist software educational, EKG parts/ rhythms and pathology recognition (disk) $ 1

SW EZCALC good spreadsheet (disk/docs) $ 1

SW FLEETSTREET PUBLISHER v1.0 3 disk set, top notch DTP program (disk) $ 1

SW FSM GDOS 5 disks (disk) $ 2

SW GDOS original Atari version 2 disks (disk) $ 2

SW GRAMSLAM grammar and style checker, checks for 1200 errors, can run as an ACC or PRG, works with all word processors (disk/docs) $ 1

SW IMAGE CAT complete graphics cataloging system for all Atari ST computers (disk/docs) $ 1

SW INTERLINK ST packaging/box only (no disk, no docs), beautfiul black plastic videotape style box with the company logo all over; slides into a white Interlink box $ 1

SW LEISURE SUIT LARRY 2(?) Looking for Love, classic sleazy fun w/pixelated nudity by Sierra (disk/docs/box) $ 2

SW LEMMINGS Oh No! More Lemmings - great puzzle game by Psygnosis (disk) $ 1

SW LIVRE Du Graphisme (disk) $ 1

SW M1 TANK PLATOON still the best tank sim out there, all original manuals (heavy Microprose kind:) and box included, includes PC/DOS version too (will run on 286&up!) (1 DOS floppy is corrupted, but I'll include a working backup) (disk/docs) $ 4

SW MACRO Mouse by Antic, record mouse actions (disk) $ 1

SW MEGATRAVELLER missing disk A it seems, disk B only (disk/docs) $ 1

SW MIGRAPH drawing utilities set includes TouchUp, MergeIt and Scan&Save, manual for Mergeit only (disk) $ 2

SW NEODESK2 v2.0 the famous desktop replacement, might be upgradable (disk) $ 1

SW NIGHTSHIFT 2 disks game by lucasfilm, so you know it's good! may need a manual for copy protection (disk) $ 1

SW OMEGA strategy game by Origi (disk) $ 1

SW OSS Personal Pascal v1.02 (disk/docs) $ 1

SW OSS Personal Pascal v2 (disk/docs) $ 4

SW PIPE DREAM game by lucasfilm, so you know it's good! may need a manual for copy protection (disk) $ 1

SW QUICKST v3 screen accelerator for ST/STe/TT (disk/docs) $ 3

SW RED STORM RISING submarine simulation 2disks one of the best realtime $ 1
strategy sim games for the Atari! amazing sim of realtime submarine combat
(disk)

SW SIMCITY the city simulator, great game! (disk) $ 1

SW SIMCITY very addictive simulation game, may need manual for copy $ 1
protection (disk)

SW STALKER 2 older version probably upgradable (disk/docs) $ 3

SW STALKER3 v3 best telecomm modem software (disk/docs/box) $ 15

SW STENO 1 older version probably upgradable (disk/docs) $ 3

SW STENO2 v2 best text editor works great with STalker (disk/docs) $ 6

SW SWIFTCALC ST by Timeworks great spreadsheet with graphing 2disks $ 3
(disk)

SW TEST DRIVE 2 the duel, European challenge addon, the supercars addon, $ 1
great car racing game with 2 bonus packs of cars! 4 disks (disk)

SW TEST DRIVE by accolade (disk/docs) $ 2

SW UIS Universal item selector v1.0 the best file selector replacement $ 1
(disk)

SW UMS Universal Military Sim, looks great especially in mono $ 2
(disk/docs/box)

SW UVK Ultimate Virus Killer (disk) $ 6

SW WARP9 speed up the graphics on all TOS machines lots! (disk/docs) $ 9

SW WORD For Word crossword puzzle creator (disk/docs) $ 1

SW WORDFLAIR v 1.1 the integrated document processor (disk/docs) $ 7

SW WORDWRITER ST a fast easy to use word processing system from Timeworks $ 2
that can interface with their Spreadsheet & DB (disk/docs/box)

SW WORDWRITER ST by Timeworks great graphical wordprocessor (disk) $ 1

SW Z-RAM Diagnostics v1.1 for use with Z-Ram RAM upgrades (disk) $ 1

SYQUEST 44MB removeable hard drive w/1 cartridge in 2-bay (1 bay free) $ 59
"shoe box" style external case incl host adapter so you can hook this drive
directly up to any ST without an expensive ICD Link. The case has a DMA thru
connector so you can still hookup your SLM or another drive. Incl DMA cable
and software. Everything you need to get going!

SYQUEST CART 44MB each in quantity of 3, no bad secs $ 16

SYQUEST CART 44MB no bad secs $ 26

SYQUEST CART 88MB no bad secs $ 30

SYQUEST CART 88MB quantity of 5, no bad secs except 1 cart $ 92

GOLF VIDEO VHS Improve Your Golf Game w/Richard Zokol, new shrinkwrapped $ 1

DAISYWHEEL PRINTER DaisyWriter 1500/2000 wide carriage, includes good $ 15
ribbon, has weird interface connector, seems to work but sold as-is

FLOPPY DRIVE 5.25" probably dead $ 1

FLOPPY DRIVE 5.25" tested, working $ 2

SIMMS 1MB 30pin, quantity 4 sold together $ 4

SIMMS 1MB 30pin, quantity 4 sold together $ 6

SIMMS 1MB 30pin, quantity 4 sold together $ 5

ATARI JAGUAR game Checkered Flag (racing) incl FREE shipping $ 8

ATARI JAGUAR game Iron Soldier (3D robot 1st person shootemup) incl FREE $ 10
shipping

ATARI JAGUAR video game console system mint condition, less than 1 year $ 48
old, lightly used, incl original boxes/manuals, A/C adapter, TV conv, 1
controller, with both games

Correct me if i'm wrong but isn't there port of netscape which runs on
68k (mainly newer, 030based) macs and supports javascript? Could that be
nice starting point to port such a browser for newer ataris too?

Why not to choose NetBSD instead of linux? It's lighter and faster and
has already one port for 060Hades. I don't know if author is willing to
port it for Milan II too.

Sure there is. But the old 68k-Netscape is not open source. The new
open source Mozilla is available and a couple of browsers are built
upon its sources - the most well known is Netscape 6. I don't think
that a 030 will be fast enough especially if you visit DHTML sites.

Oops! Yes, I never uploaded beta 13. I guess I was afraid of bad luck. :)

No, I thought I would release a complete new version, with docs and
all, but I don't have the time, so I will upload beta 2.1B-13 with
various bug fixes.

Hi Martin! :-)
Try CrazySound2 or Rational Sounds! They will do the job, and you can add
soundFX to many programs/desktop functions!

Btw: I have used the same HAL-sample myself! :-)

Best regards,

/ MRF

A very point that I have been approaching for some time. I had an Atari user group, or should I say, I am trying to bring together a group of Atarians in the Dallas area that likes to show off their bit of nostalgia, much like an old car show.

To matter the fact, we are having one in Dallas,TX area THIS WEEKEND... :)

But I think that we have two crowds (as I discovered with another user group) Those that paid much for these computers years ago and still see that as serious computers and those that have recently come in that see them as fun to play with and tinker with.

My experience was that the first crowd does not think too highly of the second crowd and are insulted at the thought of their machine being considered in the "toy" or "collectable" category.

To this I say "It is very fun toy... get over it." :)

And it is a useful toy. I'm JUST ABOUT able to do everything I need to do with a computer on my 1040ST (4 meg) and everything else is currently getting worked on.

5400. Re: the ST is dead

Newsgroup: comp.sys.atari.st
Date: 2000-05-03 00:00:00 UTC
From: dlormand@aztec.asu.edu
Message-ID: <8epl4a$8a0$1@news.asu.edu>
Source record: 62596

My point of view as an ST user (although I should get a Falcon pretty soon, right Mike?) is:

1. There is a wealth of software from the past that works on the ST that I have only scratched the surface on. I don't need to depend on NEW software to keep me interested in the old beast. Most of the basic apps like spreadsheets and word processors and such work well enough to suit my needs for home use.

2. I can accept that my STfm (even with 4MB, HD and CDROM drive and Zip) is not going to be up to the task of some important modern applications, particularly web browsing, although I haven't actually tried CAB to be in any position to say "It works well enough" or "It is not acceptable". I have come to that point long past, when I got the ST to do things my TI-99/4A just couldn't handle. Not that I gave up the TI; it still sits next to the ST. I've gotten a Linux peecee to start experimenting with things (including web browsing) that the ST can't handle. I know a lot of people with limited space (not that I have unlimited space) don't have that flexibility.

3. Having said that, one of the most attractive things about old machines is the challenge of accomplishing something with it nobody thought was possible. There is still (sort of) a project to put a TCP/IP protocol stack on the TI, for basic stuff like news, mail, and Lynx-style browsing. When I look in (rarely) on the Atari 8-bitters, they are occasionally planning how to put a browser on an 800XL-class machine. Is it impossible? Arguably. Is it FUN and WORTHWHILE trying? YES! Are you going to learn more than just buying the shrinkwrapped set from the corner peecee supermarket and mindlessly autoloading the install program? Absolutely.

4. Is there REALLY that serious an attempt to make all new Atari software backward-compatible with the ST? I can recall a flame-fest not that long ago, in which the developer was interested in preserving compatibility with ST-Low resolution, and most respondents ridiculed him for trying. Seems most Atarians aren't that interested in preserving backward compatibility anyways, hence this thread. So say a CAB author (or Wensuite, or Adamas) produced a program that ran only on Falcons and Milans and such, but not on STs, would there be that much an outcry? Not that I've heard. Are we really attacking a ghost, here?

I would appreciate attempts to produce software with modern capabilities that runs on a ST, even if it might require a memory mod and a reasonable-capacity hard drive. I would appreciate being able to use it myself, but I certainly appreciate the spirit that rises to the challenge of trying to get an old machine to do the job. But I don't expect anyone to accomodate me, and I'm certainly not going to criticize anyone for exclusively targetting newer hardware platforms. Go ahead, code for 020 or better! It still is keeping the Atari spirit alive!

Yes to all above.

Also,
- being different from the rest of the Wintel herd
- The challenge of survival against all odds
- especially, the Atari community - friends, fellow soldiers, etc.

> - you can't afford a PC even though you'd want one?

Assumes I'd want one. I can swallow Intel, with Linux or BeOS,
or even FreeDOS/NewDeal (and I have, actually), but I have
"religious" reasons (or at least plausible ethical objections)
to using any Microsoft products. But really, although there
might be a few out here that can't manage a couple hundred bucks
for an otherwise outdated P75-class machine capable of Win95, I
don't see this as a primary reason for staying Atari, in general.

A thought just occurred.

This NewDeal software for peecees now available (www.newdealinc.com) includes a web browser and is capable of running (so they advertize) on peecees all the way down to '286 with 640K and 10MB disk space. Runs on DOS. Free demo.

The peecee emulators available for Ataris... can't they handle this sort of thing?

Don't know if it has SSL and Javascript and such, but if NewDeal is supposed to be a usable software suite, albeit feature-trim, it seems like it ought to be able to do things Atarians here have complained about.

I've tried NewDeal on my lab '486, and it looks good. Don't have a peecee emulator for my STfm, but it might be something some of you might want to test.

Great! I really appriciate the possibility to turn off the "soft line end" word wrap function. This finally makes the word wrap usable at all times.

But I did found a bug so mayby you've really got bad luck :-)
Select "Utilities" - "Metric Converter" and (at least with TOS 3.01) you will get two bombs!

Also some strange #! appears in front of the message number on selected entries in the message list window.

For Swedish speaking users:
In the latest magazine "Atarimagasinet" I have written an article about Okami with a complete(?) step by step installation guide including Popwatch and Newswatch by Gary Priest. It's based on Beta 12 but there are only a few things that have changed in this new Beta 13 in O.INF.

The magazine is sent to members of SAK (Svenska Atariklubben). The membership is SEK 175:- and includes 4 issues of Atarimagasinet. Go to http://www.sak.nu/ for details!

Issue 2-2000 was sent out on Apr 25 so most members should have got it by now.

I would say the uniqueness of the applications especially when it comes to Midi stuff.For example:You can't find what Tunesmith does on a windows machine. Also..no hassels with sound cards, ect because the midi ports are built in.it is literally plug and play.(see my site for some unique midi apps)

The look and feel also, as it is between a mac and a Pc: best of both worlds.

As far as Resolutions, Falcons and TT030,s can do more then the standard ST resolutions (StLow, St med, St Hi) I use a TT030 with 1280x960 res! Also I am sure the clones can do wonderful resoltions. Also there are graphic cards you can get to speed up the other "st's .

Although SoftPC (and hence any 68030 Atari) can meet NewDeal's
requirements, I'm a bit curious as to why I'd want to. From
what I can tell of their web page, NewDeal is not superior to
CAB.

Yes there are places Cab cannot go, but for me the list is not very
big. Usually the sites that cause Cab to crash are fixed when a new
Cab.ovl update is released. Still, I agree more problems were solved
when a new upgrade of Cab itself was made available. In the long run
what you are saying is true and I sure hope that HighWire is the answer
for the Atari community unless some group of Atari programers can
update Cab since it does not look like Alexander is going to.

Some time ago I read somewhere where some group was working on porting
Netscape to the Atari world. Wouldn't that be something?? It would
solve most of our problems.

I have Soft PC running on my Hades. It is a 286 emulator, so maybe I
will give it a try and see how it goes. I am thinking of running a PC
emulator under Linux and try it out that way. I would get better output
this way.

I am not sure if NetBSD is faster. I hear tell it is the other way. I have a Hades, but use Linux. There is also a Hades version of Linux that works real well. I did try NetBSD first since a friend of mine swears by it and has it running on his TT. The problem is that the Hades version of NetBSD is ONLY compatible with the ET4000 graphics card. I have an ATI Mach 64 card, so Linux was my next choice.

I was having similar thoughts. The mainstream media occaisionally carries articles on startup internet box startup companies, that offer net boxes in the $100 to $200 price range to avoid the purchase of a PC to get on the net, kind of in the Web TV vein. One was based on a 286, and the other on a C64. Then there's the Sega Dreamcast. I thought if these boxes can do the net, the ST has got as much or more ability to do this. Again, it's an issue of having the software developed and maintained at the state of the art, which is what we keep seeing our pool of people willing to do this is diminishing. One of the officers of the company that did the net software for Dreamcast is a former Atari Corp software developer. Wonder if he could be persuaded to have his company bring the Atari to state of the art in web software....

But the other angle on PC emulators running Newdeal is intriguing. I wonder if SoftPC could run this on an Atari? Then there's the hardware emulators, AT Once, Falcon Speed, etc. Then the NewDeal site says it runs on DOSEmu under Linux.... Many possibilities here. I downloaded it tonight. Will check it's features on the PC first to see if it has the SSL, Java, HTML4 etc we need before bothering to see if it runs on the Falcon....

I guess it depends on which crowd you are talking about. Most of the
ebay activity for 2600/7800 is either the nostalgia crowd, or the new
generation retro crowd. Just cool to play the old stuff. Obviously
people like yourselves are a special class trying to push the envelope.
Just cool to see what you can get it to do!

Hi Ctirad and Derek Warren ,

>I received a reply from a gentlemen in Czecheslovakia >yesterday--apparently he's built his own accelerator for the >Falcon.

Great!

speed up CPU/BUS/RAM to 25MHz
speed up FPU to 25 or 50MHz
speed up DSP and Videl to 50MHz
100% stability !
no SDMA (SCSI, audio, floppy) problems !
cost only 60DM (20GBP, 30EUR or 200FF) !!!

Phantom SE = Phantom + 44.1 kHz audio clock generator
Phantom SE cost 75DM (25GBP, 38EUR or 250FF)

Good and cheap.
I think I'll buy this one.
Many thanks for the info Derek Warren.

For email purposes remove the <.nospam>

MfG Mathias

I am happy to report that the RealTime Manual is now available thanks
to Simon Kunath of Unstable Sounds. Go get it at:

http://www.unstable.demon.co.uk/realtime.htm

If you have not heard about RealTime, it is a fantastic algorithmic M
like sequencer.(for Atari of coarse!) It is now Freeware on my site
thanks to Eric Ameres(the original programmer) who gave me permision to
have it as a download. I wrote up a short tutorial to get people by,
but now the manual is available. A rather large File: 8.6 megs! Funny
how the actual program is less then 500K!However to get a Manual at all
is a miracle, thanks to Simons Hard work at scanning the entire manual
(150 Pages!)

Have Fun with RealTime.

BTW..if you make any compositions using RealTime or M, Eric would like
to hear them. You can send them to me and I will be happy to forward
them to Eric.

Also..I invite any of you to join the Atari-Midi mailing list. Dr T has
even joined us!(see sig)

If somebody buys a Milan II (which most likely only will be sold in very
small numbers in Germany and only to personal friends of the
manufacturers) to run Linux they're mad. Idiots. Get a PC that's cheaper,
many times faster and runs the same OS but with much better support. I
mean it.

Sounds too good to be true. From what I've understood, the oscillators to make the 44.1KHz frequency are pretty hard to find and expensive. Softjee was unable to make the Newclock cartridge for under 350FF (35GBP). How can they do this, plus an accelerator board for less.

I'd really like to see how he did this before buying it.

>among the best on our platform, but none of them will really take advantage
>of the superior hardware of that computer.. except for running faster and
>smoother that's it....

This is true to an extent. The opposite is also true to an extent. My point, I guess, is that if there are few or no programs that take advantage of the advanced hardware, doing things that are unable to be done on the ST for instance, where is the incentive to buy it? Yeah, it's fast, yeah, it's got great features, but it's less compatible with existing software which runs perfectly fine and fairly quick on the older machines. So why not take a chance, make a very impressive, ultra-modern piece of software that takes advantage of as many new features as possible, that may not run well on older machines, but runs wonderfully on the Milan/Milan II? This would possibly spark some interest in the new machines and produce a larger market for them. I was completely content with my 1200XL back in the mid 80's until I saw the MIDI apps and 512 color graphics possible on the ST and saw the wonderful and very easy to use software that took advantage of it. Then I was content with my ST until I saw Cubase Audio and True Color graphics programs and other incredible features of the Falcon, and other software that took advantage of the Falcon's features that the ST wasn't able to run. But now, I'm content with my Falcon and am not really that enticed by the Milan, because although it has features I would love to have, and is incredibly fast, I don't see any software support going into it to take advantage of it features that aren't already available on my Falcon, or wouldn't be with a simple upgrade, like a graphics card.

>Maybe we only have ourselves to blame.... Atari made a lot of faults, one
>of them was that the ST just was too good. The users didn't buy or update

>TT, MegaSTE and Falcon later on. Apple and PC users constantly updated
>their machines (they still do), giving the programmers an incentive to
>write programs that made full use of the improved hardware.

From my experience, it's been the other way around. Most of my
friends with PC's don't buy new machines every time something better
comes along. They buy new machines because they are enticed by
software as it begins to require bigger, faster machines and the
newest operating system with each new release in order to run.

>Atari users always sticked to that ST, over the years upgrading it with 4Mb

>be written by one person?
>Once we've got that browser, we'll start shouting for a DVD player, MP3,
>video editing etc, it will never really stop. There's always another
>application lurking just around the corner...

Well, if we haven't the programmers to keep to with the demands of
emerging technologies, then we really are a dead or dying platform. I
personally don't think so, as I've seen a number of great software
packages produced. I think we still have people able to do it. It's
just a matter of whether or not they're willing.

>Just suppose that every existing Atari user throws out his gear, and buys
>himself a Milan. And that Axro somehow manage to attract a whole lot of new
>users then there might be a very small chance that some programmers and
>softwarehouses decide to give it a go.... but that's dreaming of course.
>Are you willing to put your Falcon to rest today and get yourself a Milan?
>not tomorrow.... today, because tomorrow might be too late.

I would, if the software was made to support the move. I wouldn't buy
a computer if I new it would be less productive, or at most just as
productive, as the computer I already own. A computer is only as good
as the software that runs on it. Without software to take advantage
of the newer technologies, these machines will never sell, and the
platform as a whole won't advance.

>Last year a young programmer released Olympia (it's now called Phototip),

>program needs NVDI, a good desktop to act as AV server, and doesn't offer all
>features running under single TOS. With an attidude like this, we're not only
>driving away the programmers, but killing the platform at the same time.

This is unfortunately true. No programmer should ever be criticized.
It's exactly this kind of criticism that's probably keeping software
from being made for newer machines (as well as the support issues you
stated). If people get pissy because software won't run in 1Mb, or

because it requires at least 640x480 in 256 colors or more, then
where is the incentive for programmers to create bigger, better, and
more modern software?

>Software support for the new machines? I think that it's up to the MiNT
>community this time. Not so long a ago one of the major guru's bragged

>best Atari tradition of course meaning Drag&Drop, OLGA, AV, Bubblegem, DHST
>and ST Guide support, people don't buy a Milan to see programs running in a
>TOS window or even worser with a CLI.

Isn't the new Milan going to use Magic as it's OS? Also, of the above
mentioned apps, the only ones that don't exist are the browser, the
DVD player, and the drivers for a lot of PC gadgets. Papyrus Office 8
has supposedly just been release (and in English, too), GEM GS has
just released a new version, Aniplayer and Falcamp play MP3's.

>The funeral is held, it's time now to get our act together and see what's
>left under the burning ashes...
>So... who's going to get rid of his ST, MegaST, STE, MegaSTE, TT and Falcon
>and get himself a Milan???? today... not tomorrow !! and don't forget to
>support commercial software because that's where our only hope is.

This is a pessimistic attitude. I do support commercial software as
much as possible (it's just been in short supply here in the US,
keeping me from being able to purchase it -> No NVDI 5, no english
version of HD Driver, etc). I also support those who are willing to
make software and release it for free. Without shareware/freeware, I
don't think the platform would have gotten as far as it has, either.
Remember CAB was started as a freeware project. I just think that if
no software is made to support the new machines, either commercial or
free, very few would be interested in them and they will quietly pass
into history.

I've found a bug in Protext (last version, I can't remember which).
ESC-ALT-D shows the correct date, but ALT-D prints as the next day.

In other words, ALT-D has ignored the leap year, though it is supposed
to access the system date.

Anyone?

Charles.

I don't know how it performs under Linux but it's not very fast under W98/AMD K6-3/400 MHz (I'm speaking of Netscape 6PR1). So I think it wouldn't be that fast on a 040.

But since the source code is open Atari developers can take a look at the code to find out how the Mozilla developers programmed their rendering engine.

> and the other on a C64.

Actually it wasn't based on a C64. It had an AMD CPU (equal to 486),
Windows 3.1 and an older version of Netscape. The C64 emulator was just
a bonus and it was slow!
There are browsers for the C64 but they are more or less as powerful as
Lynx (i.e. text only, no JavaScript)

>Then there's the Sega Dreamcast.

The Dreamcast has more hardware power than any Atari/clone. So it's not
quite possible to compare them. But I rather browse on a PC/Mac than on
my Dreamcast (640*480 is not enough for most websites).

Even the simpliest set-top-boxes are supplied with powerful CPUs today.

Greetings,
Matthias.

Well you don't need to use an atari to be safe. Just avoid pieces
of Microsoft crap like Outlook. So far all reports I've heard say that
you only need to worry if you are a windows user and use outlook as your
mail program.

This is not the only address it can be found either.
Sanders would not be happy. He even refused the idea
that the updated version be distributed as an installer
that required the user have the original CD-ROM verified
in the player or it would refuse to install.

Sanders seems to think there is some money value in it?

It's just a rehash of all the original Atari docs in one
book. :P

I use MiNT+N.Aes daily and I do have the unix extras installed
however I do not log in, I do not prefer CLI's. In fact I
avoid them if at all possible. Anyone praising CLI's on an
Atari must be a bit abnormal. Like you I use it cause I like
the straight forward approch to the GUI. I pretty much agree
with all you said.

I just don't want to be lumped in with some stereo type
that all MiNT users like and use CLI's. Simply is not the
case with me. ;-)))

I honestly think is someone does like CLI's that much, they should
move on to a PC or something with linux.

Extremely rare nowadays. I've heard RUMORS that someone
somewhere still makes one.

>2) The Amiga sites spend a lot of time talking about "scan
doublers" to
>increase the output freq to 30Khz, assuming that this method
would work with
>the ST, how easy would it be to build one (or modify an amiga
unit)?
This is not all that easy to build, but it is really easy to
buy. There are only two problems: first, that they cost several
hundred dollars and second, that they convert COMPOSITE video.
Although the ST & Falcon have composite video ports, your
monitor is most likely connected to the superior R-G-B port.
Could a convertor be made? Probably. Feel up to it, Mario?

By the way, the reason I know this is because I have no
televisions in my house. A Commodore monitor provides a great
picture and I've been trying to figure out a way to convince my
wife that a 19" monitor (doing double duty as a T.V.) would be
worth that added cost. So far, she's been skeptical. :-<

Wow, I was surprised there were that many.

>The Milan 1 is on sale for two years, it's available from stock
right now, but
>nobody buys it... why?
Two reasons: First, I'm not convinced 25Mhz 040 is that big an
improvement over my 16Mhz 030. I could be wrong, but I've never
seen one in action. Secondly, I can't buy it at all unless I
somehow recruit someone in Germany to send it to me -- there's
no online ordering and no N. American distributor. I don't even
think there's a distributor who speaks English!

Now, if the Milan II (??Mhz 060) manages to be able to run most
Atari software and isn't as expensive as a Hades (say $1000 -
1500 USD?) I'll learn German myself if I have to!

Frankly, that's what I'm looking for. I know new features are
nice, but they come slowly. Even if they stopped coming I'd
still use my Ataris as a second computer system.

>So... who's going to get rid of his ST, MegaST, STE, MegaSTE,
TT and Falcon
>and get himself a Milan???? today... not tomorrow !! and don't
forget to
>support commercial software because that's where our only hope
is.
Points well taken. The credit card is being brushed off and
readied for some more software this week.

I firmly disagree. I've set up several Atari STs for people of
limited means who were absolutely thrilled to be able to do word
processing and email (2400 baud modems in the days when juno.com
was ASCII) for little. A word processor beats the pants off of
no keyboard any day.

5441. Lynx-styled browser for stripped ST?

Newsgroup: comp.sys.atari.st
Date: 2000-05-04 00:00:00 UTC
From: ad329@james.hwcn.org
Message-ID: <8etel5$shh@james.hwcn.org>
Source record: 62466

What I am looking for is a very simple, easy to configure text-only
browser that will work on an unexpanded 1040ST with no hard drive.
It doesn't need a lot of bells and whistles, just as long as it
at least has psuedo-frames support. I don't even need FTP support
nor mail and usenet support. Just something that will let me easily
browse the web in text only mode and is very simple to configure.

Is there anything that basic and simple for the ST? I've seen programs
like that for the Apple][so surely some Lynx-like browser would
be possible for a plain vanilla 1040ST.

Easy to use and small enough to fit and run of a single 720K floppy
and some sort of way of interpreting frames and I'll be happy.

CRACKERS
(fingers crossed from hell!!!!)

Wo! dude!, stop to breathe. You keep speaking like this you'l get branded a trouble maker. Peop's dont like hearing the truth remember.

>So... who's going to get rid of his ST, MegaST, STE, MegaSTE, TT and Falcon
>and get himself a Milan????

Not me, not unless the lottery numbers come up! Ive spent more on my MegaSTE than it would take to buy a Millan.

>today... not tomorrow !! and don't forget to support commercial software because that's
>where our only hope is.

Ive got quite a lot of personally purchased commercial software, and a lot of /registered/ shareware.

I think its safe to say i dont need anything else, ive got all that i need and have a use for. I'l keep up with upgrades where they are viable, but i'm not in the market for anything else. Unless something nice and shiney appears that i could /find/ a use for.

Source record: 62478

> I don't mean to offend anyone, but I'd really like to know
> what it is that keeps many of you Atari users so attached to
> the platform:

Mostly because I haven't found a new platform I particularly like yet. Nor am I likely to. Also, everything I want to do I can do with my old TT.

PCs have become the machine of choice for the vast herd of users who like to buy manuals with the words "complete idiot" or "dummies" in the title. As companies cater to this audience, they become less interested in users who actually program computers. For example, it have become impossible to get printer documentation beyond the "how to clear the paper path" level.

I still have nightmares about my first exposure to UNIX (no apparant design philosophy, poorly documented, and very primitive even by the standards of the day). What I know of MAC OS seems very restrictive (only PC relative addressing is allowed). BEOS is interesting, but seems even more restrictive (you MUST program in C++). My JAVA manual keeps telling me "most programmers get into trouble when they attempt ..., therefore JAVA does not allow it."

Eventually I will have to switch, if only because no one makes SCSI 1 hard drives anymore. I've been thinking about getting a VMEbus system and writing my own Kernal OS (chaos). Or I could just wait until 64 bit processors become available (especially if they are NOT backward compatible to PCs or MACs).

Sorry, I don't know the details, I got my information from
AtariMagasinet, the Swedish Atari Club's magazine. I
suppose you could try asking the guys in Poland or Scott
Sanders, the author of that work. It's pretty likely
though, since reprinting a new edition wouldn't pay
economically for the publisher. This has so far been the
fate of many a piece of Atari software, why not the books
as well?

It's not PD, and Scott Saunders probably doesn't know that someone has
made it available on the web. The JaySoft-guys asked him not long ago, and
did not get his permission to distribute their updated version.

Message-ID: <3911202F.EBE60621@intergate.bc.ca>
Source record: 62623

What is the Atari monitor scan rate (color / monochromatic)and what multisync monitor do I need to connect my Atari ST to ?

I found out one Multisync monitor with this parameters :
Horizontal Scan Rate 30kHz to 70kHz, Vertical Scan Rate 50Hz to 150Hz
Maximum Resolution of 1280 x 1024 @ 60Hz

Is this enough to have all Atari ST resolutions displayed, including monochromatic ? Will all programs work fine or no ? If all works ok then what is better 15" or 17" monitor ?

Thanks for help.

ARTUR

Ps. I think I must be one of those Atari freaks who won't let go his old good Atari STe !

No, it would only be a huge, buggy piece of shit, and probably a
worst one than the Linux 68k port even.

Sure, software tricks are still possible.

For instance, upgrading CAB to HTML 4, CSS and Javascript would still be possible, but would it run on a 4 MB machine? Hell no! CAB currently takes about 2 MB of ram already. It's not about to get any thiner on resources.

However, you can never run away from hardware limitations.

CAB will probably never be as fast as other Mac/PC browsers for formatting tables and unpacking images, because it runs over an 8 MHz system clock. However, run CAB on MagicMac over a decent Mac and it gets pretty close to it: less/no dithering to perform and a faster CPU _do_ make a difference.

So, hardware limitations are the main reason why an ST cannot be expected to cut it for heavy networking and image retouching; too slow and not enough colours.

The TT and Falcon are a bit better, but let's not fool ourselves: without a graphic card there is still a _LOT_ of speed lost to dithering, instead of straight unpacking to 16 or 24-bit.

No such effect at me (MEGA 4 STE + TOS 2.06).
But still have wrong numbers of: messages/unread/new - in a headline of
a message menu window.

"DAVID L. ORMAND" <dlormand@aztec.asu.edu> wrote in
message news:8epm21$8c8$1@news.asu.edu...

: Assumes I'd want one. I can swallow Intel, with Linux
or BeOS,
: or even FreeDOS/NewDeal (and I have, actually), but I
have
: "religious" reasons (or at least plausible ethical
objections)
: to using any Microsoft products.

I went off to NewDeal's URL and picked up the following
review by Robin Miller:
http://www.andovernews.com/cgi-bin/news_column.pl?9

Here's a quote from that article:

The best thing about New Deal Office 98 is that it will
run on almost any DOS computer, from a 286 on up, with as
little as 4 MB of RAM. The second-best thing about New
Deal 98 is Skipper, its built-in web browser. Despite the
fact that the current version of Skipper isn't nearly as
good as Navigator, Explorer, or Opera, none of these
popular browsers will run at all on a DOS-only 286 or 386,
while Skipper does just fine on these machines within its
limitations. These limitations include Skipper's inability
to display frames or run Java. Additionally, Skipper won't
do e-mail or newsgroups. So, if you plan to use New Deal
as your primary Internet tool, you'll need to find an ISP
that offers a shell account you can access through New
Deal's separate communications utility.

This sounds to me like Skipper is a cousin to CAB? A
switch to an old 286 with NewDeal would mean a pointless
360 degree turn for the average ST atarian. We have an
office suite already, and lots of other programs. For
NewDeal exists only what they produce themselves. A kind
of MagiC, huh?

I saw that you could download the entire package and try
it for 45 days. After that "you must" remove it. Obviously
only your private morale will decide wheather you'll
remove it or not...

As an alternative to using old ST:s and STE:s this is
unimpressing. Rather dig out some money and buy better

hardware. If you can't afford that, maybe you should stick to the stuff you already got?

If someone absolutely must avoid Microsoft software then there are lots of other contenders that cost very little and even are given away on magazine CD:s. The other day I received BeOS 5 on such a magazine CD. It's an excellent and impressing OS and it's free. You must have a Pentium though. And there's BSD (real Unix) and Linux (almost real Unix) that are ported to almost any platform. Both are nominally free and very sound constructions.

The whole idea of romanticizing old computer hardware and the financially weak person "who'd be so happy if only he had a word processor" is false.

In my experience most people (well-offs and paupers alike) use their computers for "non-serious purposes". Games, surfing the web to porn sites, napping music from the web, expanding their computer's hardware to no purpose etc. I even know a person that uses his PC for absolutely nothing, he just loves the tinkering. And the list of priorities can be very illogical sometimes. A friend of mine is in the process of ridding himself of his TT with 19" mono monitor in favour of a 486 with a 14" VGA. He says: "I need the color for my email". He also plans to continue producing DTP documents, but now on the 14". "I can scroll!" he says enthusiastically.

Atari made it's biggest mistake not delivering enough color with their computers, for email and such... And the casings should have been multicolored too. The new iMacs are a success, but they also do come in beige, blue, cherry and whatnot. Agfa is selling a scanner with detachable color handles... "You can swap whenever you like".

And this is neither a new phenomena nor an exclusive whim of the computer industry. Michelin, the tyre company, has for many years been devoting substantial research into producing tyres colored in different ways. DeLorean, a car producer, made all their cars in a non-rusting material that looked like brushed aluminium. The first thing that happened was that other companies offered to paint the cars in various colors, with the regrettable drawback of loosing the rust immunity in the process, but nevertheless their business bloomed...

Hopefully the Milan people are reading this...
(I want mine in British Racing Green)

Nasty Virus:

A new virus has gone round today. If you get an email from anyone with the subject - note syntax - ILOVE YOU
Do NOT open the attachment.

It is a Visual Basic script that sends itself to everyone in your address book, changes your internet browser homepage so that it tries to download a file everytime you open it (until you change the homepage back). Also it seems to rename all JPEGS to have a .vbs extension. What else it does, we are still finding out! But it seems to be keen on doing more than just propogate itself. A fix has not yet been made but keep an eye out in the usual places (www.mcafee.com etc). Current virus scanners will not detect this.

Be aware, because the virus will most likely come to you from someone you know!

Yes - those are definitely rumours, and nothing more. I guess Uwe did enough hardware extensions for original atari machines to know that he does not like working around other people's design bugs anymore. Furthermore, the Milan II project is enough work as it is.

My experience is much different. Although I do play the occasional game or two, my Falcon is used more for work/school (word processing, updating my web site, etc.), music (with Cubase Audio), and web browsing (not for porn or getting tunes off the web). Most people I know use their machines (PC's, Mac's, what have you) for similar purposes. For most areas we have very adequate software and hardware, except in the area of a good web browser, which is sorely lacking.

Why would it be slow?
Netscape and IE running on a Mac Quadra, which is the equivalent of a Milan,
both run rather smooth and quickly. Does one loose speed while porting, or is
it the code poorly written so that it is slow under Linux on a not very fast
processor (by today standards).

Cheers from Belgium
Dennis

Hi Thomas,

>No more arguments left?
Oh...plenty, but I've had this discussion here exactly one year ago, I don't like to repeat myself.

>What you might not know is that Alexander started working on iCAB _for a
>living_. I.e. it's what he gets paid for. Might have changed in the
>meantime, but it's been so I last talked to him.
TBH I don't really care how he makes his living, that's none of my business really. But he wouldn't be the first programmer working on several projects at once. Supposing he would split his time 90/10, 10 being for the Atari platform that is. We're not expecting a update every three months...

It would not only be a nice gesture of goodwill to his former clients, but it would also mean a little bit more income (however small) but most of all it could boost his ego. One of the reasons CAB being what it is today is mainly because of the continuing support, bug reports, user info, feedback etc... it didn't grow from a simple html viewer to what it is today merely because of the talent of Mr.Claus, the users have a big share. You know what I mean, I think that the same applies for Thing, where would it be without user input? Hell, he could even use us as beta testers to introduce some new features before building them in iCAB. We're used to that, everyone who bought Wensuite or Draconis Pro is a beta tester without realising it.

Papyrus, Phoenix, Kobold etc... are developed for other platforms, but they still support Atari as well. It may take a long time before a new update arrives, but it shows they still have an interest, surely these firms don't earn a lot of money either from this platform.
Could it be because there's more in life then just money? their roots are here, they probably love this platform even though they'll never be able to make a proper living from it. That's the difference between Claus and them.

Thomas, to conclude this thread which is leading nowhere, don't get the impression that I got some beef with Mr.Claus. I haven't got anything against him as a person, but as a programmer he let me down.. and unfortunately, he's not the only one :-(.
In september the EEC will have a vote over a proposed bill that forces the programmers or softwarehouses to support commercial software at least for three years after the last release.... if this proposed bill becomes a law, then discussions like this will never have to take place again...:-).
Take the money and run will be a thing of the past....

Cheers from Belgium

Hi Martin-ï¿½ric,

Jo Even Skarstein and Katherine Ellis both called me once "ignorant" because
I never looked further then my nose was long... I've kept this is mind, and
before commenting on MiNT vs flashy MagiC applications I make sure that I got
the facts right. May I suggest you do the same from now on...

>For example, let's say I need to copy a whole bunch of files from
>an FTP site. Two possibilities:
>* aFTP
> Open a connection, change to the correct directory, select the
> correct files, download, move to the next directory, etc.
>
>* wget
> Two options:
> * Recursively download the whole directory (wth a specific
> number of sub-directory depth) in background, then sort
> it all later. Really quick.
>
> * Provide a list of specific files to download, from a varied
> list of directories on different hosts. Let it fly in the
> background.
In the example given you use aFTP, why? ever heard of FiFFi 1.20? yep, that's
one of those flashy useless no good good MagiC only applications. It may
surprise you to hear that it can do all that wget can? In conjuction with ASH
Scripter (you now from that company with M$ attitudes), FiFFi will knock wget
from one corner in the room to the other.
Oh yes.... and to keep it simple in the best Atari tradition most of this can
be done with one single mouseclick, or even by Drag&Drop. Should I mention
that FiFFi needs just a simple ST with 1MB and MagiC installed to run?
Oh yes, can you explain how one makes that specific list.... don't tell me it
compiles itself magically. Before wget starts accessing the different hosts,
you need to feed it the exact paths and URL's, and in order to do that you
need to visit all the different hosts to know where exactly what is located.
Well, using a simple script that no good flashy useless MagiC application can
do this as well, but better.... input the different hosts, and name of the
specific files to download and that's it.... it will search if need be every
directory until it finds them, no need for directories and correct paths
anymore. If the line breaks down for what ever reason, it will resume the
operation at the point it left off. Oh....and all of this in the background
off course, while FiFFi is doing his thing, I can write a posting bragging
about it:-)

>> This seems an important part of Atari evolution, but it seems
>> you have to be a UNIX guru or coder to understand this and be
>> able to function in this environment.
>
>Not really. I am far from a UNIX guru; I just tend to use more
>and more commandline than before.
When the Atari ST was released, one could opt for a Macintosh or PC as well, I found the Macintosh too limited, so I opted for the ST, the major reason was the brilliant (in those days) GUI. I didn't even consider a PC, that flashing c:/ reminded me too much of the Atari 800XL I was using at that time.
In 2000, fifteen years later a bunch of people are trying to warp me back in the eighties. A commandline ? are you serious? if I feel the need to use CLI again, I can just as well go to the cellar and fire up the good old 800XL.

Sometimes, I wonder if all of you have been sniffing glue....:-/
Whenever someone praises a no good flashy MagiC only application, he's been told off because it's not following the standards. MiNT users have bombarded themselves as keepers of the flame apparently... has Atari made a testament in which MiNT is named as the official successor?
What the hell are all those programmers doing, trying to make their programs using OLGA, AV, D&D, DHST, Bubblegem... etc protocols. Let's all toss it in the bin, and use CLI from now on, we don't even need that mouse anymore !!

Has it ever occured to you that these views are only shared by a minority of the Atari community? I like the Atari GUI implementation, and regardless if one runs MagiC or MiNT, it has advanced quite a lot since 1985 giving us certain features which Apple only recently discovered, and M$ isn't aware of yet. Despite the limitations set by the hardware, our small platform and the ever decreasing number of talented programmers, we managed to follow...
I don't even like running a TOS application in a window, but using a CLI on my Atari? no way.... this is like going back 20 years in time, you really need to be some kind of fanatic to declare this the way foreward.... I think Sinclap would say a Jihad ;-)

The topic of this thread is why one stays on Atari, I know, but I wonder if you do, for months now you are praising the ported UNIX/LINUX stuff here, it has come to a point that other people start to think this it is the answer, is it really? surely this is not the best platform to run these applications?

I can sympathise that for certain tasks, there's no option other then to use a ported MiNT application, but just how many applications are there for which there's no alternative?

Last month I installed N.AES 2.0, I suppose it's me as a power user of that no good flashy MagiC OS that is spoiled, but so far I really can't see any advantage, on the contrary, a lot of programs that used to be very stable are now running unstable.
TBH it has some good point as well, graphic applications that are compiled to run on a 68030/68040, really are faster running under N.AES. I suppose it's because MiNT is optimised for the 68030 or 68040 while MagiC is not.
Regardless of the speed increase with "some" graphic applications, that's about it. I'm not going to start the discussion about the way it looks and

the poor WDialog compatibility which IMHO are crap.
I've now installed the KEMD package and MinTNet once again, this time I was determined to get it installed. I've waded through miles of docs and finally got it right (I think)..... so what? Except for 12Mb which disappears when I boot, where's the advantage? please give me a couple of examples, because being a dumb ass, I haven't got a clue, I can only say that using some of the specific ported stuff is in general harder to use then the GEM counterparts.

I haven't seen *one single* internet application that offers me more then what the flashy no good MagiC stuff offers, except for ICQ, but hating firms that have a monopoly I suppose you would never dream of using ICQ ?:-)
Is there anything else ported besides network and internet applications? if so please give me a couple of exemples, I haven't a clue... well, if there are some, I can't find them....

I just been reading the SuSE Linux thread, if that compilation ever sees the light of day, where is that going to leave all the ported MiNT stuff?
I wonder If SuSE is going to include the KDE desktop or just supply a CLI.
What do you think ?:-)

Cheers from Belgium
Dennis

From: nameerf@flash.net (Michael and Nicole Freeman)
Date: Tue, 02 May 2000 23:18:44 GMT

Hi Mike,

>So let's start focusing on software support for the new machines before
>they die off from lack of it. There's probably a lot more software already
>available for the ST than for the Milan.

You don't have to convince me about this, but its a simple question of mathemathics. If the units sold are correct, then there are about a 1000 Hades users and 1500 Milan users. What programmer is going to write for a userbase of maximum 2500 people. And considering that the small Milan group is divided into a MinT/MagiC camp, it makes this even more unlikely.
Except for a compiled MiNT and some obscure utilities, the MinT programmers can't be bothered, but then are they ever? they seem to port or write only for themselves... just suppose they would port something like GLIMP for a change, over to run on a Hades060 and the coming MilanII, there are so many brilliant applications to port, and these guys keep themselves occupied with porting over yet another newsreader or ftp program...
Why am I attacking the MiNT programmers? well, the Milan comes with MiNT installed as standard OS. One could argue that the Milan is the first MinT computer, but even the MiNT community doesn't support it... not in a proper way that is.

So, if the public market doesn't do it, the commercial market will have to take care of it... ASH, Invers and ROM to name the three major ball players are not going to cater for a measly 1500 users, if we don't get our act together and all start buying the new machines, it will never happen. The Milan 1 is on sale for two years, it's available from stock right now, but nobody buys it... why?
Without users... no software, it's as simple as one and one is two. When the Milan 2 is released it will come bundled with some programs that are among the best on our platform, but none of them will really take advantage of the superior hardware of that computer.. except for running faster and smoother that's it....

Maybe we only have ourselves to blame.... Atari made a lot of faults, one of them was that the ST just was too good. The users didn't buy or update the new machines being lounched. They constantly had to find new users. How many of us thrown out the ST and updated to the STE?, not to mention the TT, MegaSTE and Falcon later on. Apple and PC users constantly updated their machines (they still do), giving the programmers an incentive to write programs that made full use of the improved hardware.
In the late eighties there were some small firms producing accellerators, graphic cards, memory boards etc... how many people actually bought them?

Not enough to make sure those firms survived. Similar firms on the Amiga and Apple platform are still around...
Atari users always sticked to that ST, over the years upgrading it with 4Mb and a harddisk, I think it's a miracle what the programmers have achieved on this platform, we can do it all.... but at a price.
The price we're paying becomes more obvious every day, the applications we've got today are written mainly to run on that damned ST. Our users base has denimished in something obscure, and the competent programmers have left us long ago... have you considered that the programmers which are still supporting our platform, maybe just aren't good enough to write that browser we all are hoping for? who would write it? can a browser like this be written by one person?
Once we've got that browser, we'll start shouting for a DVD player, MP3, video editing etc, it will never really stop. There's always another application lurking just around the corner...
How many people here have put a PAK/68 upgrade in their ST, how many people are using a graphic card, how many are still limited by 4MB? upgrading these machines to an acceptable level is possible since years....

Just suppose that every existing Atari user throws out his gear, and buys himself a Milan. And that Axro somehow manage to attract a whole lot of new users then there might be a very small chance that some programmers and softwarehouses decide to give it a go.... but that's dreaming of course.
Are you willing to put your Falcon to rest today and get yourself a Milan? not tomorrow.... today, because tomorrow might be too late.

Where does that software support is supposed to come from? if you're hoping that the existing base of programmers catering for MiNT, public domain and shareware is going to take care of it, dream on... they haven't got it in them... the Atari community is a very strange breed, spitting on commercial software is one of the favourite items. Look back at the postings of the last year.... for every commercial package someone pops up with an answer, of a public or shareware program. I'm not against public domain software but it's slowly killing or platform.
Here's just one example: when ASH released CAB, it came with IConnect and a OVL. IConnect was the first stack other then MinTNet that offered PAP. When STiNG was released shortly after, that was it... certainly when it became known that the demo version of CAB could be used to go online using STinG and one of the alternative OVL's. It took two long years before those OVL's were just as good as the one that comes supplied with CAB. The programmer doesn't improve the original CAB.OVL anymore, why should he? where's the incentive? in another thread that's running here Thomas Binder explains why Alexander Claus left the Atari platform, everyone who's using one of the CAB demo's to surf online is partly to blame for this. It has come to a point now where some people are asking why we need IConnect and the clients? The programmer of Teli, Fiffi and Chatter certainly is delighted to read this kind of crap, the users of his programs are called "morons", there's no sign of appreciation, why would he continue supporting Atari? take a look at his website, compare the features of his programs with what's available for the other stacks....
Last year a young programmer released Olympia (it's now called Phototip),

considering his age and that this is one of his first programs, I would say he's like an uncut diamond, we should treasure people like him. What does he get for his efforts from the Atari community? abuse.. all I've seen so far is negative criticism, not one word of praise. Some people even wondered why his program needs NVDI, a good desktop to act as AV server, and doesn't offer all features running under single TOS. With an attidude like this, we're not only driving away the programmers, but killing the platform at the same time.

Why use MagiC when there's MinT, why use Imagecopy when there's Gemview, why use Photoline when there's Digilab, why use HD Driver when there's AHDI, why use Jinnee when there's Thing, why use anything commercial when you could just as well use something that is free or can be obtained for a very small fee?... fine, just look where it brought us.
If I have to believe some people here, we don't need dedicated programmers anymore, all that we want is already available, it's just a matter of porting it over <grin>.

Software support for the new machines? I think that it's up to the MiNT community this time. Not so long a ago one of the major guru's bragged about the fact that there are now actually more MiNT users then MagiC users. Well, let them do it for a change... let them surprise us from now on, I'm really looking foreward to see the first applications appear like a modern fast browser, office suit, PDF reader, realtime MP3, DVD player and a lot of drivers because we need to be able to attach the latest gizmo's, all in the best Atari tradition of course meaning Drag&Drop, OLGA, AV, Bubblegem, DHST and ST Guide support, people don't buy a Milan to see programs running in a TOS window or even worser with a CLI.
You know the outcome just as well as I do : nothing will ever come from that site. If you like some port of yet another obscure network utility, you're in the right place. Don't ask anything else.

The funeral is held, it's time now to get our act together and see what's left under the burning ashes...
So... who's going to get rid of his ST, MegaST, STE, MegaSTE, TT and Falcon and get himself a Milan???? today... not tomorrow !! and don't forget to support commercial software because that's where our only hope is.

Cheers from Belgium
Dennis

The problem is that navigation bars etc. take a lot of space. Even if you don't use absolute sizes there may not be much room for the content. TV browsers also use a bigger font size so that the text is readable on every TV screen.

Greetings,
Matthias.

"Michael and Nicole Freeman" <nameerf@flash.net> wrote in
message news:DriQ4.7712$wb7.532284@news.flash.net...

: My experience is much different. Although I do play the
: occasional game or two, my Falcon is used more for
: work/school (word processing, updating my web site,
: etc.), music (with Cubase Audio), and web browsing (not
: for porn or getting tunes off the web). Most people I
: know use their machines (PC's, Mac's, what have you) for
: similar purposes. For most areas we have very adequate
: software and hardware, except in the area of a good web
: browser, which is sorely lacking.

I don't MIND people using their computers for
"non-serious" purposes! Not the slightest. Note my
citation marks, btw. If games are your bag, go for it. If
you like porn, no problem. What I wanted to point out was
the wrongness of the romantic view of computer usage as
primarily "serious".

I fully believe you that you and your aquaintances use
your computers the way you described, but you (us) people
are a minority. It is easy to get mislead by the line of
reasoning where you count yourself and your friends as the
general norm. We all tend to associate with people who are
like ourselves, don't we?

I personally never play computer games and consequently I
don't associate with gamers. This doesn't at all mean that
most computer users aren't using games.

The idea of "serious" computer usage as the dominant one
is antiquated. And even in the serious field there are
tendencies towards incomprehensible folly. Like my friends
wish for color on the screen even for the price of
swapping 19" to 14".

In the academic and business fields there's pretty much
wordprocessing going on, but a home user that works in a
factory and has no abition becoming a novelist, how much
wordprocessing is he needing? To write the occasional
letter once in six months perhaps.

Let's face it: Serious computing is a primary excuse for
buying a computer, but comes in many, many, cases as
secondary usage-wise.

The 'COMPOSITE video to VGA' converters are not that expensive.
I bought one recently for 69 dollars to use my Atari 800XL with
my new 17" Multisync, BTW with great results ;)
Now I'm wondering too why there are no 'RGB to VGA' converters.
In the worst case (when my RGB monitor quits) it seems I'll
have to buy a 'RGB to COMPOSITE video' converter (these exist)
to be able to use the 'COMPOSITE video to VGA' with the 1040ST too.

Hi guys,

you don't need to use a timeserver on your own provider.... ANY
timeserver will serve, as long as you've got an Internet connection.
I use zeus.tamu.edu for about a year now, fast (splitseconds or maybe
1-2 secs to get a sync) and reliable. If you have a program for
timeservers, fill in any one on the connection line.

But the text is, by definition, wraping to the next line of the
visible screen size, in HTML, so that's not a problem, UNLESS
someone insists upon assuming that everyone uses 12-point fonts
on Internet Explorer to view their site.

Not so rare, if you know where to look. However, people are
usually not interrested in paying for anything, so very few of
the available cards have been sold, except for Best's stock.

AG Komputertechnik still has several Reibls, in all shapes and
sizes, while some dealer in Netherlands (I forgot who) still has
the "very rare" Bionet ACSI adapter in sufficient stock.

As for the french cards, Berny Diotte (address on my FAQ) bought
some when attending an Atari show in Europe a few years ago.

>to adapt STing so that STing user could access the RMA again.

The last version of STiNG on www.rottengatter.de was updated in March
'98. That gives me v1.15 which won't let me into Chapelie. Where's v1.22 ?

Thank's Again,
"Augeas"

One slight detail, though, is that we do not have any NTP or SNTP client on neither MiNT-Net nor STinG; we only have the older UNIX time protocol on port 37.

On STinG, the package by Ronald Anderson includes both a time client and a server.

On MiNT-Net, inetd 0.2 includes a built-in time daemon, while the client is rdate.

Here, I use this protocol to synchronize old ST machines with the TT's own RTC.

>Gerhard

I was thinking about this also (RGB to VGA).
I was thinking that while it's not simple to do, it should not be too
expensive either.

My idea was to have a circuit which stored one scan line of the ST (at 15.625
KHz), then while the next line is being scanned, the previous line is being
read out at twice the rate (31.25 KHz).

I think there are TV chips made by Philips that can do scan conversion.
Perhaps one of these could be adapted to work.

I've not sat down & investigated all of the technical details, so I might be
making some incorrect assumptions or leaving out some important details.

I do know that scan converters are available, but they used to be big
machines, with lots of frame stores. Perhaps storing a complete page (32Kb) of
ST graphics, then converting it is a better way to go?

Quit trollering. You know I sold my Atari ST... like seven
years ago or something. And now I wish I hadn't.

Also, I spent a great deal of yesterday in a BadAzz-Power-
Winebego (like in the hit movie "Twister") only this one had
twenty year old computing equipment. And was owned by the
U.S. Forest Service. There is nothing cooler than rack
mount HP scientific equipment. And a rack mount 8 inch disk
drive.

There are also Amiga models: 1438S (the one I have, 15-40 kHz and 50-90 Hz,
14', stereo, also sold under Microvitec brand) and 1960 (not sure about this
one).

I just found it odd that this message was posted to comp.sys.atari.st,
because AFAIK there is no version of Outlook, or any VB script client,
for the ST. It's like whenever I get a message like "THEIR IZ A NEW
RILLY BAD VIRUZZZ THAT KILLS OUTLOOK AND BREAKS UR BROWSER!!!!!!!!1!!1"
I just laugh in self righteous indignation; "Ha Ha HA!" I say, "I use
LINUX!"

One may wonder why I was reading c.s.a.s, well I like to keep abreast of
goings on in the cool-yet-obsolete-computer community. Same reason I
read stuff in the comp.sys.amiga and comp.sys.apple2 hierarchies.

: So why not take a chance, make a
: very impressive, ultra-modern piece of software that
: takes advantage of as many new features as possible,
: that may not run well on older machines, but runs
: wonderfully on the Milan/Milan II?
: This would possibly spark some interest in the new
: machines and produce a larger market for them.

You are so right, this is commonly referred to as a
"killer application". One spreadsheet program kicked off
the sales for the original PC, DTP programs sold the Mac,
and Cubase and Calamus did the same for Atari. Amiga had
the Genlock feature. You could use it for video titling
without additional hardware.

We can see that in the case of the Amiga's genlocking and
the Atari's Cubase the killer application software heavily
depended on the presence of built in hardware. It was
possible to add MIDI to the Amiga and genlocking to the
Atari aftermarket, but there was considerable extra cost
involved. Factory fitted these features cost almost
nothing to include.

So the Milan people should maybe think about including
some unique hardware from factory and that way inspire
programmers to write amazing software for that hardware?

Problem is what?

First time I heard the term Midi was when I bought my
first ST, same thing with the DSP on the Falcon. Who can
say what's all out there?

: ...no english version of HD Driver...

??? You must have a real old version? HDDRIVER has been in
English for a long time now.

Not very common these days. :-(

However, I bought a Microvitec 1438 about 5 years ago for my Falcon, which will is both a RGB and SVGA monitor and works in all modes with both ST and Falcon! However, the screen display is not as good as my SVGA Sony 15sf so I don't use it very often. I don't know if they're still available.

Also, I have a Phillips CM8833 which was very common several years ago - this is an RGB monitor and therefore scans at 15KHz, but is not VGA.

I think the Milan crew should create a new web browser specially for the Milan II only. Maybe a whole new set up with dialer, email FTP, newsgroups, web browsing etc. all in one neat package. This should take addvantage of the better hardware and show it off a little.
The Milan II is supposedly being made in co-operation with Motorola and a range of software developers are working on Milan gear like software, hardware add-ons and so on. Looks impressive.
As someone said on another thread, theres no point buying a new computer if it only provides a speed increase and a higher graphics res if there is no software to push it to it's limits.
I would seriously think about getting a Milan II if there was some real good software support.

A new browser to support HTML/Java (even Flash 4!)
Maybe a new version of Cubase? (Atari have always had the musicians support since they launched the ST with midi ports and it'll be nice to see them come back using them in studios etc.)

I'm really hoping they can get this right and maybe one day in the future we'll all be surfing the net on a Milan II.

M-E,

yes, I was referring to the Sting stack, I have been using Gary's
Spawner in conjunction with some timeserver client from another Swede
or Norwegian (too long ago to remember details) which IIRC could be
set to any timeserver around. I used it then on the Demon.nl
timeserver, but I think any one will do.
Since I use the PC (sorry), I use Tardis, which will use any server
around. Like I said, usually a split-second, you even won't notice the
timesync until afterwards you read its log :-)

ST 520, upgraded to 2.5Mb RAM and TOS 1.9. Fitted with 80286 emulator. 80Mb hard drive, second floppy drive. No monitor.

Much software, including Protext, That's Write, spreadsheet, database, several BASIC's. All with manuals. Lots of other software, but no games.

It was all working up to a couple of years ago, when the monitor packed up and I stored it all in the loft.

Anyone like to make me a reasonable offer for this? Prefer not to split, but will if necessary.

I'm afraid the purchaser will either have to collect from South Yorkshire, or arrange carriage.

Please reply by e-mail and not to the group.

Many thanks

Keith Powell

If it is the Milan OS, it needs to be supported properly by Milan If
they are serious about it, they need to be as aggressive about keeping
it current as Microsoft is about Windows.

Hmm, I'm not a MiNT goeroe so I let the answer to someone else.
Since a few months I'm using ext2fs. I've the feeling ext2fs runs much
better then minix.
One ext2fs is 200 Mb, the other 268 Mb.

Ext2.xfs requires a XHDI compatible harddisk driver.
It also requires a recent FreeMiNT version (at least 1.15.1 beta 0.6).

I also do have MiNT/MiNT-net/N_AES. There was a time I never used a CLI
but since the day I have remote access to the RMA which hosts the Belgian
Atari ftp-server I'm forced to use CLI's. At the beginning I wasn't very
keen to do so but now I just love it. Like Martin-ï¿½ric says in another
posting sometimes a CLI is much faster to get some things done then doing
it with a GEM application. However if there is a GEM alternative I prefer
to use this instead of the CLI. OTOH I use more and more WGET to download
stuff. It works really very fast. Furthermore as a MiNT-net application it
really doesn't block/slow down the system when it is downloading things.

>I just don't want to be lumped in with some stereo type
>that all MiNT users like and use CLI's. Simply is not the
>case with me. ;-)))

As said I start loving it. Why? Maybe because I can say 'hey Mama look what
I can :-))'
When I use a CLI I've the feeling I'm working with the computer and not
otherwise.
>
>I honestly think is someone does like CLI's that much, they should

I can see your point. A 486 running Netscape is what pushed me into an
AMD K6-2 300. The older Netscape of course isn't going to get into any
more sites than CAB either.

5514. Re: Why stay on Atari?

Newsgroup: comp.sys.atari.st
Date: 2000-05-05 00:00:00 UTC
From: John Kolak <jkolak@netzero.net>
Message-ID: <39131C67.84E9560B@netzero.net>
Source record: 62423

Lots of good points here, and a good recap on my frustrations chasing
the Holy Grail. I guess MiNT isn't the answer I was looking for.
Following a link from www.siliconfruit.com/mint/ I read someone saying
MiNT will run ported Linux apps, so I envisioned Star Office coming to a
MiNT equipped TOS computer near you. Come to find out, it isn't possible
on our outdated X11 port. And I feel about the same as you about
learning UNIX to be a MiNT power user. My head is already swimming from
learning DOS junk, and I am not up to learning UNIX/LINUX/MiNT. Not
today anyway.

No, I'm saying that this newsgroup is intended for information
on Ataris. If WW3 broke out tomorrow I'd like to hear about it,
but not on this newsgroup.

>I apologise if my posting offended anyone ...
No offense taken. I might be a bit too rabid sometimes about
off-topic posts.

Whooa Nelly!! don't buy it?
Ha!
You can't get it in Canada. period.
No dealers allowed over here.
because Milan had a hard time meeting the need in Europe/Germany apparently.

There had better be a Canadian, or at least a USA, dealer for the Milan2!!!
or else... ;-)

> >oppose to relative sizing, for table widths).
> >
> Err, I've been using absolute sizing (590 pixels) for quite a
> while. How does one use relative sizing?

Relative sizing produces tables in relation to the visible
screen size. Here's a sample:

Left
Center
Right

The above would produce a table equal to 90% of the available
screen width, with each cells being a percentage of the total
table width. The advantage is, no matter what screen size or
font size one uses, tables still keep the same proportions.

Images still need to be sized in absolute pixels (relative
scaling doesn't work the same for images, because is a percentage
of the image size's size in pixels, not of the screen size):

For this reason, W3C is working on various vector image formats,
to eventually allow documents that are _completely_ resolution-
independant, including images. This will result in documents
that keep the same proportions, no matter what the user has set
as viewing preferences (e.g. font points size, available viewing
area, etc.).

>'98. That gives me v1.15 which won't let me into Chapelie. Where's v1.22 ?

You need to get v1.20, and then upgrade to v1.22.

You need to delete everything from v1.15 except your DEFAULT.CFG and
DIAL.SCR files before installing, otherwise you get conflicts.

Get v1.20 and v1.22 from my website.

http://www.users.zetnet.co.uk/jfhaslam/atari.htm and follow the downloads
link.

Cheers!

Spawner is an SNTP client? That's news to me.

> Since I use the PC (sorry), I use Tardis,

We got that installed at work. Great little application, which
can use time (37) over either UDP or TCP, or proper NTP and SNTP
network time protocols, and many other methods of fetching time.

Simple, efficient, and cleanly coded. I love it.

If you don't understand what he's talking about, I didn't, then read this:

http://www.zdnet.com/zdtv/freshgear/meetourcrew/story/0,3679,2150193,00.htm
l

If you have a windows pc handy, go here: http://grc.com/default.htm and
click on `shields up' and then go here: http://grc.com/optout.htm and see
if Aureate has a little friend in your system. I recommend his zone alarm,
set on the highest setting, you might be surprised at how many people are
out there, looking for open ports on your pc. Then, if you have the time,
try http://secure-me.net/ (requires registration) for a more thorough
analysis.

>Spawner is an SNTP client? That's news to me.

M-E,

nah, not Spawner. That's a program to use on the batch function of
Sting, you can start a lot of prg's simultaneously from it. Nope, the
timeserver prg itself was, like I said from another one (Swedish or
Norwegian). Tiny one, and it did the trick well.

It must be around on the net, perhaps others know more details rite
now, if not, I'll have to cranck up this old TT again and get more
details :-)

I got it as one of the first apps running under Win :-) Since it was
installed it uses zeus, and that one is f-a-s-t!

: being scanned, the previous line is being read out at
: twice the rate (31.25 KHz).

I've been thinking along the same lines. If this device is
being built as an external one, then it could be adjusted
to work with both Ataris and Amigas. This seems to imply
an AD converter, a data doubler and finally a DA
converter. Also new sources for HS and Vs would have to be
created.

Why not write a proxy server that will take a complex web page and convert it into something easier that a 1meg ST can digest. It would convert JPEGs to a simpler graphics format, and automatically dither it. It wouldn't solve the Javascript problem, but it could offer SSL (at least from the proxy site, but it does open up a lot of security issues!)

This is how Web TV works, and one of the Palm (which only has a 68000!) web browsers (I think TopGun?)

It could actually become an open source project to allow all sorts of devices with limited hardware to access the web!

No you come on, someone was refering to unix stuff at a prompt.
I did not say keyboard equivalents were the same or that
people that use them are abnormal. What I meant to say
is if you boot your Atari into MiNT with no GEM and
like it that way... then you could be considered abnormal.
The main reason for having an Atari is the GUI.

In fact it is 50 years.

Commandline typing started when a electrical typewriter (teletype or telex) was
successfully connected to a computer for the very first time.
At the same time there were already people hating repeatedly typing the same.
Those people punched their commands in cards or in paper tape.

Before that, computers were operated by flipping switches.

> How many of us thrown out the ST and updated to the STE?, not
> to mention the TT, MegaSTE and Falcon later on.

I successively sold my STFM, then STE along the upgrade path. I
still have the TT. I kept each machine for about 4 years each.

> Are you willing to put your Falcon to rest today and get
> yourself a Milan? not tomorrow.... today, because tomorrow
> might be too late.

I don't have a Falcon, but since my TT still does what I need
(except it doesn't currently have a graphics card) I don't feel
any need to get a Milan.

> It took two long years before those OVL's were just as good

What about aMail, aFTP and Taskbar? Last I checked, those were
all GEM applications for MiNT.

> the same from now on...

Likewise, as it seems you are not realy familiar with KEMD or MiNT enough to comment. Sorry to say, but kellis has been a Magic beta-tester for quite a while and I have tried Magic (and MagicMac) on more than one occasion. In fact, I am currently hunting down old colour 68k Powerbooks to run MagicMac.

Btw, I have tried Fiffi before but, because ASH tried reinventing the wheel by creating yet another TCP/IP stack, instead of using STinG or MiNT-Net API, I have left it at that one single test.

However, i-Connect still doesn't do PPP in a way that most North American servers can understand, while MiNT-Net does, which is why I waited until I reached Europe before I was able to test it.

> >Not really. I am far from a UNIX guru; I just tend to use more
> >and more commandline than before.

> In 2000, a bunch of people are trying to warp me back in the
> eighties. A commandline ? are you serious?

Definitely.

For certain things, it is simply quicker to type a couple of commands than to do a dozen of mouse clicks. For others things, I prefer GEM applications and, on MiNTOS, I can choose which way I will go on a case-by-case basis.

> I can sympathise that for certain tasks, there's no option
> other then to use a ported MiNT application, but just how
> many applications are there for which there's no alternative?

It's not a question of, if there is a GEM alternative, use it at all cost. It's a question of, which way will be the quickest for a given task. Sometimes, it's GEM applications and sometimes it's CLI utilities.

> I'm not going to start the discussion about the way it looks and
> the poor WDialog compatibility which IMHO are crap.

Even under SingleTOS, Wdialog is crappy enough to randomly crash
everything, as I experienced way back on the STE.

> I've now installed the KEMD package and MinTNet once again,

I cannot remember how many times I have said it recently:
most people only need MiNT-Net and N.AES. Period.

> I just been reading the SuSE Linux thread, if that
> compilation ever sees the light of day, where is that going
> to leave all the ported MiNT stuff?

Why bother getting a Milan, if it is only to run Linux. might as
well buy a cheap PC. However, if what you want is a GEM box that
is expandable and technicolor, then by all means, get a Milan.

Hi all,

I work for a telecommunications company supplying super dooper Pentium based test instrumentation at a very high price to the worlds major telecoms companies. At work I use a P3 450Mhz PC.

These are just a few of the reasons I've stuck with my Atari's.

1. Today I watched the I love you virus screw up 90% of our network at an alarming rate, with reports from a lot of the companies we supply suffering the same fate. This is the first time I've seen a virus do its thing. Amazing bit of programming, but the damage it's done is nuts. Tomorrow I'm taking my Stacy to work because I'm sick of reloading PC's. Sometimes it pays to be the minority.

2. As I'm sure you all know. My STE and Stacy chug along at 8MHz with an operating system of approx. a massive 300k (TOS/Magic). It makes the speed of my works PC look C$!P.

3. I play keyboards in a band and over the years have amassed an array of equipment. My STE was originally purchased for this purpose but ended up being used for just about everything. I run the lot from cubase using 64 channels. I like cubase VST very much, but have seen it crash to often to make me want to spend the vast amount I'd need to to upgrade to a set-up which would cover what I do at present.

Now the hypocrite bit. This email was typed and sent from my PC at home. Used primarily for work, the NET and doing WEB pages for our band. This is the one thing I feel does let my much loved Atari's down. High Res COLOUR graphics. Oh and Magic's annoying me as well. Will be asking questions later on the latter.

SORRY. I've had my moan. Needed to get if of my chest.

Richie B.

P.s. For you techies:
Running STE and Stacy with 4Mb of RAM, 540Mb HDD in each, ZIP 250 drive (This gets used on my STE, Stacy, Korg Triton, Korg D16 and my PC), Magic 6, NVDI 5, Jinee 2 when I receive it, DB3, EDGE, Cubase with 64 channels out, Scooter, Extendos Gold and CD writer 2+. I'll get round to buying the CD writer one day. I find it brilliant that a 15 year old computer can still compete with the rat race with out half the hassle.

Hi Nick,
2 questions:

1) How common are monitors that scan as low as 15Khz?

2) The Amiga sites spend a lot of time talking about "scan doublers" to increase the output freq to 30Khz, assuming that this method would work with the ST, how easy would it be to build one (or modify an amiga unit)?

Agreed. If you manage to contact him via e-mail, I certainly wouldn't
mind hearing his story. Too bad he doesn't have access to Usenet.
Still, if this is a scam, a Falcon030 accelerator card is a bit of an
odd product to be scamming people with. %-) I'm a bit skeptical about
it even existing. Even a picture or something would help a bit, eh?

Back when I had the idea of issuing a programmer's tool kit on
CD, I contacted Sanders for permission to include a corrected
Compendium, along with docs on recent protocols and extensions
(e.g. STiK, CAB, OLGA, etc.) and his attitude was:

- "Toad already paid me a ridiculously low amount when I took
the HTML'izing upon myself for their CD, so there's no way you're
getting anything from me without a few thousand dollars upfront
and a percentage on the sales."

- "Do you really expect anyone to make money out of this?"

- "Same to me. I worked hard for this and should be paid."

> It's just a rehash of all the original Atari docs in one
> book. :P

True, but it's rather difficult finding copies of "internal"
developper's kit, compared to buying a book from Amazon.

I suppose if you can change floppies every two minutes, sure.

I compiled Links for MiNT. It's a Lynx clone that handles tables.

You would need one boot floppy with MiNT and MiNT-Net (something
like PPP-Kit should do), AES 4.1 and TosWinII.

Not very common at all. There are certainly none made any more. The only ones I know about are the old NEC multisync monitors, but there may be others.

RGB colour monitors are closer to a TV set than to modern VGA screen.

> 2) The Amiga sites spend a lot of time talking about "scan doublers" to

No idea. Has it ever been done? It sounds like a risky assumption to me.

```
STinG and CAB can be installed on a floppy (well, 2 actually), but it will
be very slow, mainly because the CAB.OVL downloads files, writes them to
disk, and then CAB reads them. This means lots read/writing on the floppy.

You really need at least more RAM. You can do without a hard drive and use a
RAMdisk as the cache directory. Try getting your hands on a 4Mb expansion
(if it's an STE, it's easy).

There is a text file about setting this up in the Quick FAQ.

WenSuite is supposed to run on a 1Mb ST too, but to be honest I wouldn't
even try.

Oops, didn't know that.

The VME Reibls are already very rare beasts, so I wonder what the chances of finding a MegaBus version are? I've never heard of the french one either.

So by definition you are saying that everyone reading this message is doing so using an Atari?

It was a simple posting to warn others of a potentially nasty virus that has affected a lot of companies around the world - I appreciate that Atari's are "bomb proof" in this respect and can also understand why you feel the need to jump on the anti-Microsoft bandwagon.

I apologise if my posting offended anyone - I saw two postings with the virus attached and wanted to warn others that are forced to use Windows products at work due to company policy to be careful!

Sorry for stepping out of line - I thought I was doing the right thing but obviously not.

Michael

5555. What the lovebug virus does!!

Newsgroup: comp.sys.atari.st
Date: 2000-05-06 00:00:00 UTC
From: Ian <ian_m_phillips@yahoo.com>
Message-ID: <3913878a@news.server.worldonline.co.uk>
Source record: 62351

This is the notice sent by J.ELLO about the LOVEBUG virus...

WHAT IT DOES
If Love hasn't taken advantage of yet today, here's the details.
It's a cyber-sexually transmitted disease that comes to you in the form of an email titled "ILOVEYOU". There is an attachment in the mail called "LOVE-LETTER-FOR-YOU.TXT.VBS". This is a vb-script that is activated when you launch the attachment. It first puts itself on your hard drive and enters a line in your registry to re-launch it when your machine boots up. It sends itself to everyone in your address book once, then marks your registry to prevent it from continuing to send. If you have mIRC, it will try to DCC itself to everyone in the channel you are on. It also sends your computer to an internet site to download a password-stealing executable file. The passwords it collects are sent to a site, supposedly owned by the author of the worm. To further irritate matters, it deletes all .jpg images it can find on any drives connected to your computer, local and network. It also creates files of the same name as the deleted ones, attaching a ..VBS extension to the end of it. These are NOT renamed files, the original files are deleted... the new .VBS files are copies of the original worm script. If you clean the worm off your system, but execute one of those new .VBS files, you will be infected again. The script does a similar number on other files, including .mp3's, ..mp2's, and .jpe's.
There is one more effect that I have yet to figure out, and not many people seem to have noticed it... but if you have your My Computer window set to "view as Web Page", the layout of changes in such a way that makes it very difficult to use. Cleaning the worm doesn't seem to cure it and you have to set it to "classic" mode, but then, I was using a very early cleaner... I'm sure someone will figure it out shortly.
While there are a couple similarities between this and the infamous Melissa, Melissa was designed for stealth. Melissa made limited use of your address book and did little or no real damage. Love, however, lives up to it's name, to do significant damage as rapidly as possible. Oh sure, you'll get over Love... but in the meantime it tears you up.

Graham Cluely, noted text adventure writer, informs us via the BBC that 'I Love You' is some sort of 'worm', or 'virus' type of thing, and may modified. Some U.S. Congressman or other was also overheard proclaiming that 'we have 21st century crimes, and we need 21st century laws to deal with them!'. Naturally I have no idea what he's talking about either. I suppose he means systematic round-the-clock monitoring of all internet traffic for suspicious text strings like 'I Love You', that might be construed as an hostile attack! Special 'Rainbow Six' type assault teams will be dispatched via black helicopter to the basements of any phillipino thirteen year old miscreants who may be perpetrating these threats on our national security. Only then will our nation's great Congresspeople be safe to mindlessly allow their bloated, wide open Microsoft products to automatically run whatever code is sent to them by anybody in the whole world who feels like taking the time to do so. Saying 'pull my finger' in a public place will also become grounds for summary execution by government rooftop sentries.

Hi Martin,

correct. I couldn't stand not knowing any longer :-) so I fired up the
old TT and checked out. It was an archive TIME.LZH, if I recall OK it
was then available from Peter R.'s pages. Had 4 little apps to use
plus nice docs. For Sting, you had to use the batch function. I used
Spawner since it can do much more than fire up one app. Anyway, it
worked nicely, just in the background and IIRC, all you had to do was
fill in the name of ANY timeserver (I used the T-BATCLK.APP).

Now remember, timeservers work in UTC. It's your local computer stuff
(timezone settings etc whereever) that determine what time is
displayed and used by the system!

Steve, if you're running Sting, try and fetch the lil' thing and check
it out. If you can't find it, I'll be glad to email it to you.

I can confirm the 1960 handles the ST video modes. This is the monitor I
use to handle both the ST modes and the output from the NOVA card on the
Mega STE.

The 64-bit Alpha architecture has been around since 1992.
There is also UltraSPARC, and all manner of workstation
RISC architectures employing 64-bit, some since almost
half a decade.

Well "Love" didn't touch me but email virii are the easiest to shield against,
though
I'm quickly sending this out in OE, I took the precaution of opening my email
in Pine under the Lynx shell.

The love virus seem to attack Windoze boxes where ppl are running OE or
Communicator as their only mail/news program and as such they get caught
unawares, Windows users running a text-based mail prog like Agent or even
Pine for Windows if they open the attachment it just reads out as garbage
characters and can't execute. Alot depends on your level of security setting
too, though I'm using it I've never trusted Wintel the way some do so I have
barriers set up to prevent html and other scripts from running in email, I've
even
nuked some birthday cards ppl have sent me because they were silly enough
to use html and JavaScript, better safe than sorry.

To respond to this message, please use the enclosed address link rather than using your reply button

Last Updated 05/06/00
- New Items Added, Sold Items removed

I have the following Atari ST components, software and manuals/magazines for sale. All the equipment is cleaned and detailed, and in good or better condition, but without boxes unless noted. If you have any questions in regards to unit condition, please feel free to ask.

All prices quoted are in U.S. funds with the buyer paying shipping. For items that I am taking offers on (no price listed), please make all offers in U.S. funds. I am also willing to trade for certain items, please see my list at the end of this post.

If you are interested in any of these items, please respond to Jim at jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.ST (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

Hardware Please make an offer
==========
- Atari 520 ST - with mouse but missing power supply (fully functional)
- Atari SC1224 Monitor 13" ST Color Monitor
- Atari PCT1426 Monitor 14" High Resolution TT/PC Color Monitor
- Atari SF354 3.5" Floppy Drive - with drive cable, no power supply
- Atari SLM804 Laser Printer - boxed with power supply and Laser Printer Controller - deal pending
- Roland PR1011 Dot Matrix - Boxed with Cables
- Atari Megafile 44 with built-in Tape Backup - with power supply and cable
- Atari Megafile 60(s) - with power supply (two units left)
- Magic Sac 1 - Macintosh Emulator Cartridge (with manuals, but NO ROMS)
- Magic Sac 1+ - Macintosh Emulator Cartridge (with manuals and ROMS)
- Custom made Atari RGB/Audio cable. Connects an Atari ST to either a SONY XBR or XBR II RGB Monitor
- Best Data Smart One 2400X - External 2400 baud modem with power supply

Controllers Please make an offer
==========
- Paddles (multiple sets) - for Atari & Commodore units
- 2x Suncom Tac Joysticks - for Atari & Commodore units
- 1x Spectravideo Joystick with suction cup base - for Atari & Commodore

units

ST Software Please make an offer
==========
- UltraScript for MEGA ST- by Atari (with manual & software)
- Ultra Script Type Collection - Packages 1-7 (Complete with box, manuals, & software)
- Macro Mouse - The mouse recorder (Complete with packaging, manuals, & software)
- Calamus Desktop Publishing (Complete with box, manuals, & software)
- Spectre GCR Mac Emulator with ver. 3.0 update manual (Box, manuals, software - NO ROMS or cartridge)
- Flash Telecommunications package (Complete with packaging, manuals, & software)
- Flash II Telecommunications package (with manual and software)
- Dungeon Master - by FTL (Complete with box, manuals, & software)

ST Books Please make an offer
==========
- Atari ST Volume One VDI
- Atari ST Volume Two AES
- Atari ST GEM Programmers Reference
- Atari ST Tips & Tricks
- Atari ST Internals
- Programmers Guide to GEM
- MC68040 32-Bit Microprocessor Users Manual - by Motorola
- MC68000 8/16/32-Bit Microprocessor Users Manual (eighth edition) - by Motorola

Manuals & Technical Guides (software status specified) Please make an offer
==========
The majority of the ST/TT manuals are of the binder variety
- Micro C Shell - by Beckemeyer Development Tools (without software)
- LDW Power Spreadsheet - by Logical Design Works (without software)
- Superbase Personal - by Precision Software (without software)
- dBMan - by Atari (without software)
- 1st Word Plus - by Electric Distribution (without software)
- HyperPaint - by Atari (without software)
- Easy Draw - by Migraph (without software)
- Regent Base/ Regent Base 2 - by Regent (without software)
- Publishing Partner Professional / PageStream -by Soft Logic (without software)
- Publishing Partner - by Soft Logic (without software)
- Touch-Up - by Migraph (without software)
- Microsoft Write - by Atari (without software)
- Codekeys The Macro Tool - by CodeHead Software (without software)
- Degas Elite - by Integral Solutions (without software)
- Brataccas - by Psygnosis (without software)

Atari Force Comics Please make an offer
==========
All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for or towards rare or shrink-wrapped/sealed
titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- A working first generation Dish Network receiver
- A working 4000 series Dish Network receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard (should I
be so lucky :)

Properly written, a web page is supposed to be backwardly
compatible all the way back to "text-only" browsers so that
"limited hardware" (like cell phones, internet appliances,
and browsers with disabled features) can still make use of
the site.

Unfortunately, most web site authors write to "a browser"
instead of to "the standard" (<http://www.w3c.org>, I think.
Or maybe it's .com....) which is the root cause of the
problem.

Why should I? I hate to adapt my settings to correct someones fault.

This week's www.ntk.net is indispensible:

And who do we love? We love the journalists who, despite
having the source of the ILOVEYOU virus repeatedly delivered
to them as an attachment, said that it "could steal your
bank details" (Channel 5) and that it affected Macintoshes
(BBC News Online), but not users of the "Lycos operating
system" (The Times). We loved NETWORK ASSOCIATES boast that
they "believed [it] to have originated in Manila" and "We
have the name of who we think it is, but we're not saying"
(amazing detective work, given that the handle and location
of the author is in the first line of the script)...

Hi Sean

>Could i use any time server for that matter?, if so do you know of one?.

>Can't you use "time.demon.co.uk"? I have this set up with my system and
>works fine when called. I am not with demon but it works anyway.

I plumbed that it and Net-Time needed a IP no which con-info gave me, but now i got it going it dont seem much use, i cant set my system time by it as it dont display seconds and the year is displayed as '10', a possible Y2K bug.

Sorry to have taken a while replying to this - I'm still in shock after moving house !! Anyway, I have had an e-mail from the author confirming that he doesn't mind me posting about Highwire to the newsgroup. He is indeed Robert Goldsmith, although I don't know anything about IRC so I can't confirm if he is also "Nevlyn".

Robert still has his finals to finish at University, but he assures me that he is working on Highwire. He is a very enthusiastic and lively person and I am sure that when he can really concentrate on the browser it will turn out fine.
